

可热插拔型双线式总线缓冲器

 查询样品: **TCA4311A**

特性

- 工作电源电压范围：2.7V 至 5.5V
- 支持 I²C 总线信号的双向数据传输
- 对 SDA 及 SCL 线路进行了缓冲，因而增加了扇出数
- 在所有的 SDA 及 SCL 线路上均进行了 1-V 预充电，可防止在背板上进行带电电路板的插拔操作时发生损坏
- SDA 及 SCL 输入线路与输出隔离
- 可适应标准模式及快速模式 I²C 器件
- 抗噪声性能有所改善
- 其应用包括带电电路板插入及总线扩展
- 低 I_{CC} 芯片停用模式：<1 μA
- READY 开漏输出
- 支持时钟展宽、仲裁及同步
- 断电高阻抗 I²C 引脚
- 开漏 I²C 引脚
- 锁存性能超过 100 mA（符合 JESD 78，II 类规范的要求）
- 静电放电 (ESD) 保护性能超过 JESD 22 规范要求
 - 8000-V 人体模型 (A114-A)
 - 200-V 机器模型 (A115-A)
 - 1000-V 充电器件模型 (C101)

D 封装或 DGK 封装
(顶视图)

说明/订购信息

TCA4311A 是一款可热插拔型 I²C 总线缓冲器，支持在带电背板上进行 I/O 板卡的插拔操作，而不会损坏数据和时钟总线。控制电路可防止背板与板卡相连接（直到背板上出现停止命令或总线空闲为止），而不会在板卡上发生总线争用的情况。当建立连接时，该器件可提供双向缓冲，从而使背板及板卡电容保持隔离。在板卡插入过程中，SDA 及 SCL 线路被预充电至 1V，以最大限度地减小对芯片的寄生电容进行充电所需的电流。

当 I²C 总线空闲时，可通过将 EN 引脚设定为低电平来把 TCA4311A 置于停机模式之中。当 EN 引脚为高电平时，TCA4311 将恢复正常运作。该器件还包括一个开漏 READY 输出引脚，该引脚负责在背板与板卡侧相连时发出指示信号。当 READY 引脚为高电平时，SDAIN 和 SCLIN 被连接至 SDAOUT 和 SCLOUT。当两侧断接时，READY 引脚为低电平。

背板及板卡均可采用 2.7V 至 5.5V 的电源电压来供电，而对于它们哪一个的电源电压较高则未做限制。

TCA4311 具有标准的开漏 I/O。至 I/O 的上拉电阻器的大小取决于系统，不过，该缓冲器的每一侧均必须设有一个上拉电阻器。这款器件专为与标准模式及快速模式 I²C 器件（而不是 SMBus 器件）一起工作而设计。在可以接受标准模式器件和多个主控器的通用型 I²C 系统中，标准模式 I²C 器件只规定了 3mA。在某些条件下，可以采用高终端电流。

TERMINAL FUNCTIONS

SOIC (D) OR MSOP (DGK) PACKAGE		DESCRIPTION
PIN NUMBER	NAME	
1	EN	Active-high chip enable pin. If EN is low, the TCA4311A is in a low current (<1 μ A) mode. It also disables the rise-time accelerators, disables the bus precharge circuitry, drives READY low, isolates SDAIN from SDAOUT and isolates SCLIN from SCLOUT. EN should be high (at V_{CC}) for normal operation. Connect EN to V_{CC} if this feature is not being used.
2	SCLOUT	Serial clock output. Connect this pin to the SCL bus on the card.
3	SCLIN	Serial clock input. Connect this pin to the SCL bus on the backplane.
4	GND	Supply ground
5	READY	Connection flag/rise-time accelerator control. READY is low when either EN is low or the start-up sequence described in the operation section has not been completed. READY goes high when EN is high and start-up is complete. Connect a 10-k Ω resistor from this pin to V_{CC} to provide the pull up.
6	SDAIN	Serial data input. Connect this pin to the SDA bus on the backplane.
7	SDAOUT	Serial data output. Connect this pin to the SDA bus on the card.
8	V_{CC}	Supply power. Main input power supply from backplane. This is the supply voltage for the devices on the backplane I ² C busses. Connect pullup resistors from SDAIN and SCLIN (and also from SDAOUT and SCLOUT) to this pin. Place a bypass capacitor of at least 0.01 μ F close to this pin for best results.

Input-Output Connection						
V_{OS}	Input-output offset voltage	10 k Ω to V_{CC} on SDA, SCL, $V_{CC} = 3.3\text{ V}$, ⁽¹⁾	0	100	175	mV
C_{IN}	Digital input capacitance				10	pF
V_{OL}	Output low voltage, input = 0 V	SDA, SCL pins, $I_{SINK} = 3\text{ mA}$,	0		0.4	V
I_I	Input leakage current	SDA, SCL pins = $V_{CC} = 5.5\text{ V}$			± 5	μA

(1) The connection circuitry always regulates its output to a higher voltage than its input. The magnitude of this offset voltage as a function of the pullup resistor and V_{CC} voltage is shown in the Typical Performance Characteristics section.

OPERATION

Start-Up

When the TCA4311A first receives power on its V_{CC} pin, either during power-up or during live insertion, it starts in an undervoltage lockout (UVLO) state, ignoring any activity on the SDA and SCL pins until V_{CC} rises above 2.5 V.

During this time, the 1 V precharge circuitry is also active and forces 1 V through 100-k Ω nominal resistors to the SDA and SCL pins. Because the I/O card is being plugged into a live backplane, the voltage on the backplane SDA and SCL busses may be anywhere between 0 V and V_{CC} . Precharging the SCL and SDA pins to 1 V minimizes the worst-case voltage differential these pins will see at the moment of connection, therefore minimizing the amount of disturbance caused by the I/O card.

Once the TCA4311A comes out of UVLO, it assumes that SDAIN and SCLIN have been inserted into a live system and that SDAOUT and SCLOUT are being powered up at the same time as itself. Therefore, it looks for either a stop bit or bus idle condition on the backplane side to indicate the completion of a data transaction. When either one occurs, the part also verifies that both the SDAOUT and SCLOUT voltages are high. When all of these conditions are met, the input-to-output connection circuitry is activated, joining the SDA and SCL busses on the I/O card with those on the backplane, and the rise time accelerators are enabled.

Connection Circuitry

Once the connection circuitry is activated, the functionality of the SDAIN and SDAOUT pins is identical. A low forced on either pin at any time results in both pin voltages being low. For proper operation, logic low input voltages should be no higher than 0.4 V with respect to the ground pin voltage of the TCA4311A. SDAIN and SDAOUT enter a logic high state only when all devices on both SDAIN and SDAOUT release high. The same is true for SCLIN and SCLOUT. This important feature ensures that clock stretching, clock synchronization, arbitration and the acknowledge protocol always work, regardless of how the devices in the system are tied to the TCA4311A.

Another key feature of the connection circuitry is that it provides bidirectional buffering, keeping the backplane and card capacitances isolated. Because of this isolation, the waveforms on the backplane busses look slightly different than the corresponding card bus waveforms, as described here.

Input to Output Offset Voltage

When a logic low voltage, V_{LOW1} , is driven on any of the TCA4311A's data or clock pins, the TCA4311A regulates the voltage on the other side of the chip (call it V_{LOW2}) to a slightly higher voltage, as directed by the following equation:

$$V_{LOW2} = V_{LOW1} + 75 \text{ mV} + (V_{CC}/R) \times 100$$

where R is the bus pullup resistance in ohms (Ω). For example, if a device is forcing SDAOUT to 10 mV where $V_{CC} = 3.3$ V and the pullup resistor R on SDAIN is 10 k Ω , then the voltage on SDAIN = $10 + 75 + (3.3/10000) \times 100 = 118$ mV. See the *Typical Performance Characteristics* section for curves showing the offset voltage as a function of V_{CC} and R.

Propagation Delays

During a rising edge, the rise-time on each side is determined by the combined pullup current of the TCA4311A boost current and the bus resistor and the equivalent capacitance on the line. If the pullup currents are the same, a difference in rise-time occurs which is directly proportional to the difference in capacitance between the two sides. This effect is displayed in [Figure 1](#) for $V_{CC} = 3.3$ V and a 10-k Ω pullup resistor on each side (50 pF on one side and 150 pF on the other). Since the output side has less capacitance than the input, it rises faster and the effective t_{PLH} is negative.

There is a finite propagation delay, t_{PHL} , through the connection circuitry for falling waveforms. [Figure 2](#) shows the falling edge waveforms for the same V_{CC} , pullup resistors and equivalent capacitance conditions as used in [Figure 1](#). An external NMOS device pulls down the voltage on the side with 150 pF capacitance; the TCA4311A pulls down the voltage on the opposite side, with a delay of 55 ns. This delay is always positive and is a function of supply voltage, temperature and the pullup resistors and equivalent bus capacitances on both sides of the bus. The *Typical Performance Characteristics* section shows t_{PHL} as a function of temperature and voltage for

10-k Ω pullup resistors and 100 pF equivalent capacitance on both sides of the part. By comparison with Figure 2, the $V_{CC} = 3.3$ V curve shows that increasing the capacitance from 50 pF to 100 pF results in a t_{PHL} increase from 55 ns to 75 ns. Larger output capacitances translate to longer delays (up to 150 ns). Users must quantify the difference in propagation times for a rising edge versus a falling edge in their systems and adjust setup and hold times accordingly.

Figure 1. Input-Output Connection t_{PLH}

Figure 2. Input-Output Connection t_{PHL}

Rise-Time Accelerators

Once connection has been established, rise-time accelerator circuits on all four SDA and SCL pins are activated. These allow the user to choose weaker DC pullup currents on the bus, reducing power consumption while still meeting system rise-time requirements. During positive bus transitions, the TCA4311A switches in 2 mA (typical) of current to quickly slew the SDA and SCL lines once their DC voltages exceed 0.6 V. Using a general rule of 20 pF of capacitance for every device on the bus (10 pF for the device and 10 pF for interconnect), choose a pullup current so that the bus will rise on its own at a rate of at least 1.25 V/ μ s to guarantee activation of the accelerators.

For example, assume an SMBus system with $V_{CC} = 3$ V, a 10-k Ω pullup resistor and equivalent bus capacitance of 200 pF. The rise-time of an SMBus system is calculated from $(V_{IL(MAX)} - 0.15$ V) to $(V_{IH(MIN)} + 0.15$ V), or 0.65 V to 2.25 V. It takes an RC circuit 0.92 time constants to traverse this voltage for a 3 V supply; in this case, $0.92 \times (10$ k $\Omega \times 200$ pF) = 1.84 μ s. Thus, the system exceeds the maximum allowed rise-time of 1 μ s by 84%. However, using the rise-time accelerators, which are activated at a DC threshold of below 0.65 V, the worst-case rise-time is: $(2.25$ V – 0.65 V) \times 200 pF/1 mA = 320 ns, which meets the 1 μ s rise-time requirement.

READY Digital Output

This pin provides a digital flag which is low when either EN is low or the start-up sequence described earlier in this section has not been completed. READY goes high when EN is high and start-up is complete. The pin is driven by an open drain pull-down capable of sinking 3 mA while holding 0.4 V on the pin. Connect a resistor of 10 k Ω to V_{CC} to provide the pullup.

EN Low Current Disable

Grounding the EN pin disconnects the backplane side from the card side, disables the rise-time accelerators, drives READY low, disables the bus precharge circuitry and puts the part in a near-zero current state. When the pin voltage is driven all the way to V_{CC} , the part waits for data transactions on both the backplane and card sides to be complete (as described in the Start-Up section) before reconnecting the two sides.

Resistor Pull-Up Value Selection

The system pullup resistors must be strong enough to provide a positive slew rate of 1.25 V/μs on the SDA and SCL pins, in order to activate the boost pullup currents during rising edges. Choose maximum resistor value R using the formula:

$$R \leq (V_{CC(MIN)} - 0.6) (800,000) / C$$

where R is the pullup resistor value in ohms, $V_{CC(MIN)}$ is the minimum V_{CC} voltage and C is the equivalent bus capacitance in picofarads (pF).

In addition, regardless of the bus capacitance, always choose $R \leq 16 \text{ k}\Omega$ for $V_{CC} = 5.5 \text{ V}$ maximum, $R \leq 24 \text{ k}\Omega$ for $V_{CC} = 3.6 \text{ V}$ maximum. The start-up circuitry requires logic high voltages on SDAOUT and SCLOUT to connect the backplane to the card, and these pullup values are needed to overcome the precharge voltage.

Systems With Disparate Supply Voltages

In large 2-wire systems, the V_{CC} voltages seen by devices at various points in the system can differ by a few hundred millivolts or more. This situation is well modeled by a series resistor in the V_{CC} line, as shown in [Figure 13](#). For proper operation of the TCA4311A, make sure that $V_{CC(BUS)} \geq V_{CC(TCA4311A)} - 0.5 \text{ V}$.

APPLICATION INFORMATION

Live Insertion and Capacitance Buffering Application

Figure 10 through Figure 11 illustrate the usage of the TCA4311A in applications that take advantage of both its hot swap controlling and capacitance buffering features. In all of these applications, note that if the I/O cards were plugged directly into the backplane, all of the backplane and card capacitances would add directly together, making rise- and fall-time requirements difficult to meet. Placing a TCA4311A on the edge of each card, however, isolates the card capacitance from the backplane. For a given I/O card, the TCA4311A drives the capacitance of everything on the card and the backplane must drive only the capacitance of the TCA4311A, which is less than 10 pF.

Figure 10 shows the TCA4311A in a CompactPCI™ configuration. Connect V_{CC} and EN to the output of one of the CompactPCI power supply Hot Swap circuits. Use a pullup resistor to EN for a card side enable/disable.

V_{CC} is monitored by a filtered UVLO circuit. With the V_{CC} voltage powering up after all other pins have established connection, the UVLO circuit ensures that the backplane and card data and clock busses are not connected until the transients associated with live insertion have settled. Owing to their small capacitance, the SDAIN and SCLIN pins cause minimal disturbance on the backplane busses when they make contact with the connector.

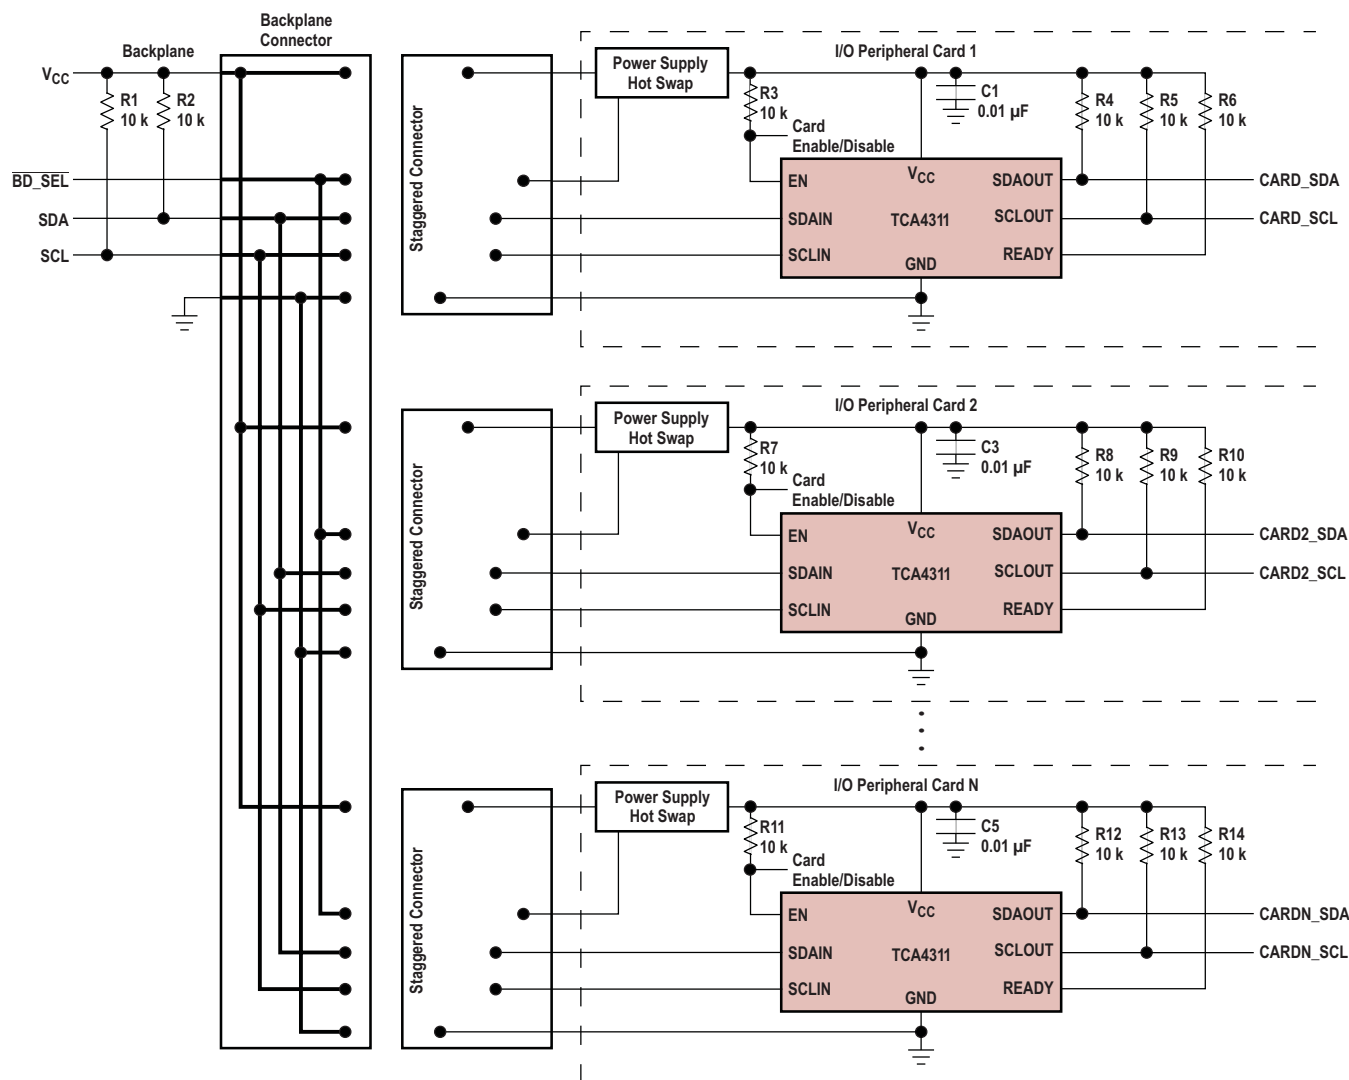

Figure 10. Inserting Multiple I/O Cards into a Live Backplane Using the TCA4311A in a CompactPCI System

Figure 11 shows the TCA4311A in a PCI application, where all of the pins have the same length. In this case, connect an RC series circuit on the I/O card between V_{CC} and EN. An RC product of 10 ms provides a filter to prevent the TCA4311A from becoming activated until the transients associated with live insertion have settled.

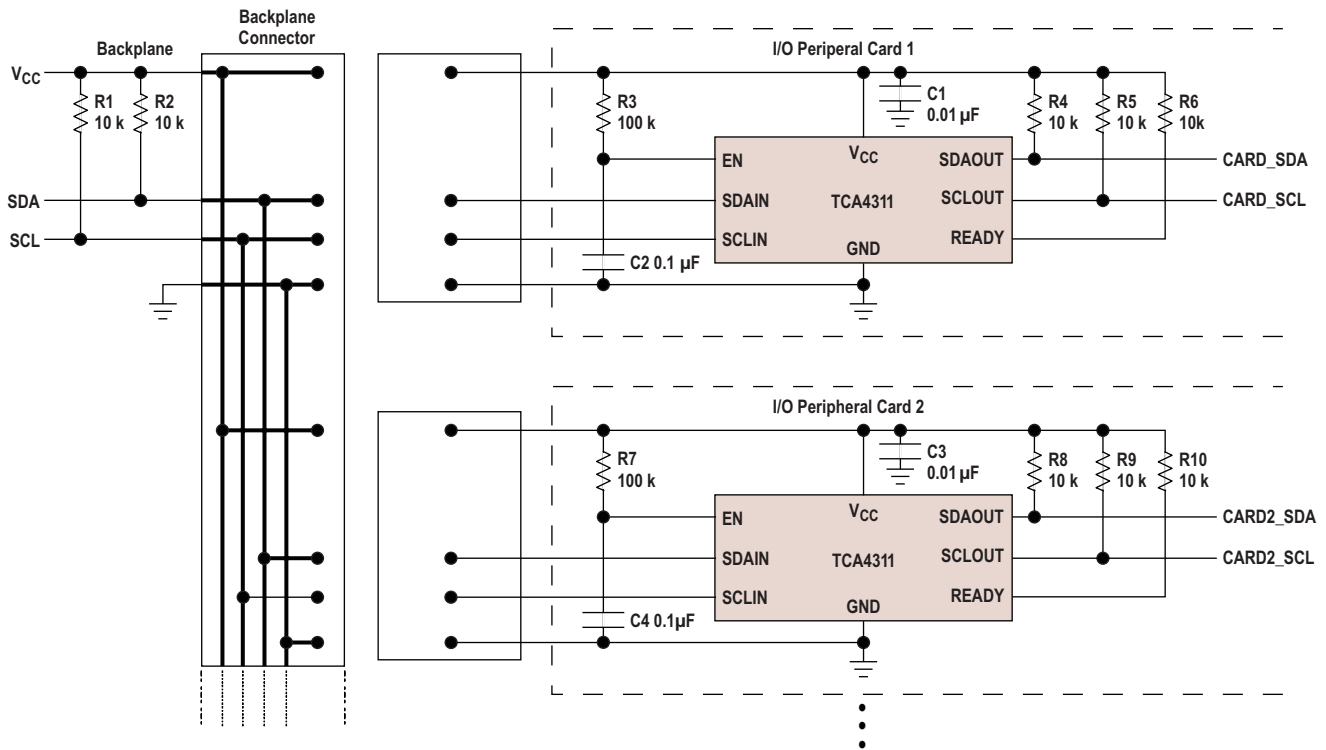

Figure 11. Inserting Multiple I/O Cards into a Live Backplane Using the TCA4311A in a PCI System

Repeater/Bus Extender Application

Users who wish to connect two 2-wire systems separated by a distance can do so by connecting two TCA4311A back-to-back, as shown in Figure 12. The I²C specification allows for 400 pF maximum bus capacitance, severely limiting the length of the bus. The SMBus specification places no restriction on bus capacitance, but the limited impedances of devices connected to the bus require systems to remain small if rise- and fall-time specifications are to be met. The strong pullup and pulldown impedances of the TCA4311A are capable of meeting rise- and fall-time specifications for one nanofarad of capacitance, thus allowing much more interconnect distance. In this situation, the differential ground voltage between the two systems may limit the allowed distance, because a valid logic low voltage with respect to the ground at one end of the system may violate the allowed V_{OL} specification with respect to the ground at the other end. In addition, the connection circuitry offset voltages of the back-to-back TCA4311A add together, directly contributing to the same problem.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. 复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和该等应用中所用 TI 产品的功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关 TI 资源。但并未依据禁止反言原则或其他法律授予您任何 TI 知识产权的任何其他明示或默示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或与美国 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
