LM2705 Micropower Step-Up DC-DC Converter With 150-mA Peak Current Limit

1 Features

- 2.2-V to 7-V Input Range
- 150-mA, 0.7-Ω Internal Switch
- Adjustable Output Voltage up to 20 V
- Input Undervoltage Lockout
- 0.01-µA Shutdown Current
- Uses Small Surface-Mount Components
- Small 5-Pin SOT-23 Package

2 Applications

- LCD Bias Supplies
- White-LED Backlighting
- Handheld Devices
- Digital Cameras
- Portable Applications

3 Description

The LM2705 is a micropower step-up DC-DC converter in a small 5-pin SOT-23 package. A current-limited, fixed-off-time control scheme conserves operating current, which results in high efficiency over a wide range of load conditions. The 21-V switch allows for output voltages as high as 20 V. The low 400-ns off-time permits the use of tiny, low-profile inductors and capacitors to minimize footprint and cost in space-conscious portable applications. The LM2705 is ideal for LCD panels requiring low current and high efficiency as well as white-LED applications for cellular phone back-lighting. The LM2705 device can drive up to 3 white LEDs from a single Li-Ion battery. The low peak-inductor current of the LM2705 makes it ideal for USB applications.

Device Information[1]

Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	SW	Input	Power switch input. This is the drain of the internal NMOS power switch. Minimize the metal trace area connected to this pin to minimize EMI.
2	GND	—	Ground - tie directly to ground plane.
3	FB	Input	Output voltage feedback input — set the output voltage by selecting values for R1 and R2 using: R1 = R2 × (V_{OUT} / 1.237 V) –1
4	$\overline{SHDN}$	Input	Active low shutdown - drive this pin to > 1.1 V to enable the device. Drive this pin to < 0.3 V to lace the device in a low-power shutdown.
5	VIN	Input	Analog and power input supply pin

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)(2)

		MIN	MAX	UNIT
VIN			7.5	V
SW voltage			21	V
FB voltage			2	V
$\overline{\text{SHDN}}$ voltage			7.5	V
Maximum junction temperature, T_J(3)			150	°C
Lead temperature	Soldering (10 seconds)		300	°C
	Vapor phase (60 seconds)		215	°C
	Infrared (15 seconds)		220	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) If Military/Aerospace specified devices are required, contact the TI Sales Office/Distributors for availability and specifications.
(3) The maximum allowable power dissipation is a function of the maximum junction temperature, $T_{J(MAX)}$, the junction-to-ambient thermal resistance, $R_{\theta JA}$, and the ambient temperature, T_A. See *Thermal Information* for the thermal resistance. The maximum allowable power dissipation at any ambient temperature is calculated using: $P_{D(MAX)} = (T_{J(MAX)} - T_A) / R_{\theta JA}$. Exceeding the maximum allowable power dissipation will cause excessive die temperature.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2000	V
		Machine model(2)	±200	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) ESD susceptibility using the machine model is 150 V for SW pin.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Supply voltage	2.2		7	V
SW voltage, maximum			20.5	V
Junction temperature(1)	–40		125	°C

(1) All limits specified at room temperature and at *temperature extremes*. All room temperature limits are 100% production tested or specified through statistical analysis. All limits at temperature extremes are specified via correlation using standard statistical quality control (SQC) methods. All limits are used to calculate average outgoing quality level (AOQL).

6.4 Thermal Information

THERMAL METRIC(1)		LM2705 DBV (SOT-23) 5 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	164.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	116.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	27.8	°C/W
ψ_{JT}	Junction-to-top characterization parameter	13.6	°C/W
ψ_{JB}	Junction-to-board characterization parameter	27.3	°C/W

(1) For more information about traditional and new thermal metrics, see *Semiconductor and IC Package Thermal Metrics*.

6.5 Electrical Characteristics

Unless otherwise specified, specifications apply for T_J = 25°C and V_{IN} = 2.2 V.

PARAMETER		TEST CONDITIONS	MIN (1)	TYP (2)	MAX (1)	UNIT
I_Q	Device disabled	FB = 1.3 V		40		µA
		FB = 1.3 V, –40°C to 125°C			70	
	Device enabled	FB = 1.2 V		235		
		FB = 1.2 V, –40°C to 125°C			300	
	Shutdown	$\overline{SHDN}$ = 0 V		0.01	2.5	
V_{FB}	Feedback trip point			1.237		V
		–40°C to 125°C	1.189		1.269	
I_{CL}	Switch current limit			150		mA
		–40°C to 125°C	100		180	
I_B	FB pin bias current	FB = 1.23 V (3)		30		nA
		FB = 1.23 V, –40°C to 125°C (3)			120	
V_{IN}	Input voltage	–40°C to 125°C	2.2		7	V
R_{DSON}	Switch R_{DSON}			0.7		Ω
		–40°C to 125°C			1.6	
T_{OFF}	Switch off time			400		ns
I_{SD}	$\overline{SHDN}$ pin current	$\overline{SHDN}$ = V_{IN}, T_J = 25°C		0	80	nA
		$\overline{SHDN}$ = V_{IN}, T_J = 125°C		15		
		$\overline{SHDN}$ = GND		0		
I_L	Switch leakage current	V_{SW} = 20 V		0.05	5	µA
UVP	Input undervoltage lockout	ON/OFF threshold		1.8		V
V_{FB} hysteresis	Feedback hysteresis			8		mV
$\overline{SHDN}$ threshold	$\overline{SHDN}$ low			0.7		V
		–40°C to 125°C			0.3	
	$\overline{SHDN}$ high			0.7		
		–40°C to 125°C	1.1			

(1) All limits specified at room temperature and at *temperature extremes*. All room temperature limits are 100% production tested or specified through statistical analysis. All limits at temperature extremes are specified via correlation using standard statistical quality control (SQC) methods. all limits are used to calculate average outgoing quality level (AOQL).
(2) Typical numbers are at 25°C and represent the most likely norm.
(3) Feedback current flows into the pin.

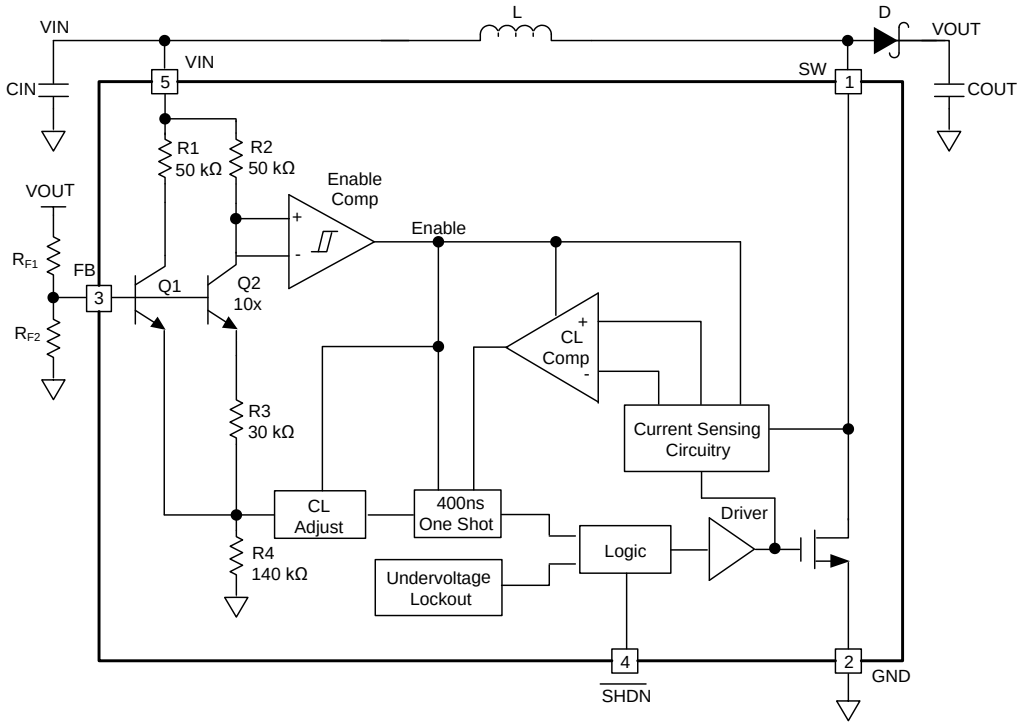
7 Detailed Description

7.1 Overview

The LM2705 is a small boost converter utilizing a constant off time architecture. The device can provide up to 20.5 V at the output with up to 150 mA of peak switch current.

7.2 Functional Block Diagram



Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

The LM2705 device features a constant off-time control scheme. Operation can be best understood by referring to *Functional Block Diagram* and Figure 11. Transistors Q1 and Q2 and resistors R3 and R4 of *Functional Block Diagram* form a bandgap reference used to control the output voltage. When the voltage at the FB pin is less than 1.237 V, the Enable Comp in *Functional Block Diagram* enables the device, and the NMOS switch is turned on pulling the SW pin to ground. When the NMOS switch is on, current begins to flow through inductor L while the load current is supplied by the output capacitor C_{OUT}. Once the current in the inductor reaches the current limit, the CL comp trips, and the 400-ns one shot turns off the NMOS switch.The SW voltage then rises to the output voltage plus a diode drop, and the inductor current begins to decrease as shown in Figure 11. During this time the energy stored in the inductor is transferred to C_{OUT} and the load. After the 400-ns off-time the NMOS switch is turned on, and energy is stored in the inductor again. This energy transfer from the inductor to the output causes a stepping effect in the output ripple as shown in Figure 11.

This cycle is continued until the voltage at FB reaches 1.237 V. When FB reaches this voltage, the Enable Comp disables the device, turning off the NMOS switch and reducing the I_Q of the device to 40 µA. The load current is then supplied solely by C_{OUT} indicated by the gradually decreasing slope at the output as shown in Figure 11. When the FB pin drops slightly below 1.237 V, the Enable Comp enables the device and begins the cycle described previously.

7.4 Device Functional Modes

The $\overline{\text{SHDN}}$ pin can be used to turn off the LM2705 and reduce the I_Q to 0.01 µA. In shutdown mode the output voltage is a diode drop lower than the input voltage.

8 Application and Implementation

NOTE

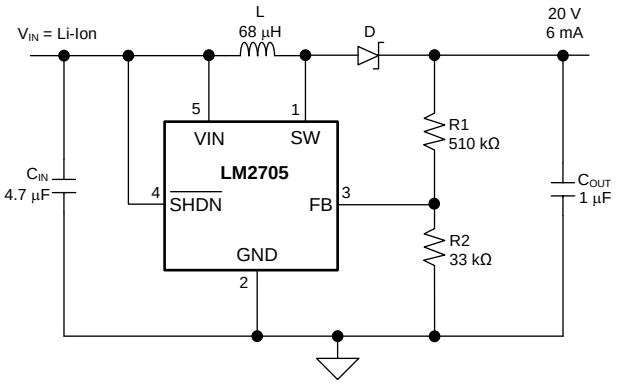
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LM2705 is a 20-V boost designed for low power boost applications. Typical input voltage range makes this ideal for standard single cell Li+ batteries or 2 to 4 series alkaline batteries.

8.2 Typical Application

Figure 12 shows a typical Li+ voltage range to 20-V application. The 68-µH inductor allows for a low ripple current and high light-load efficiency.



Copyright © 2016, Texas Instruments Incorporated

Figure 12. Typical 20-V Application

8.2.1 Design Requirements

For typical DC-DC converter applications, use the parameters listed in Table 1.

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	2.5 V to 4.2 V
Output voltage	12 V
Output current	up to 8 mA
Inductor	33 µH

8.2.2 Detailed Design Procedure

8.2.2.1 Inductor Selection - Boost Regulator

The appropriate inductor for a given application is calculated using Equation 1:

$$L = \left(\frac{V_{OUT} - V_{IN(min)} + V_D}{I_{CL}} \right) T_{OFF}$$

where

- V_D is the Schottky diode voltage
- I_{CL} is the switch current limit found in the *Typical Characteristics*

- T_{OFF} is the switch off time (1)

When using this equation be sure to use the minimum input voltage for the application, such as for battery powered applications. For the LM2705 constant-off time control scheme, the NMOS power switch is turned off when the current limit is reached. There is approximately a 100-ns delay from the time the current limit is reached in the NMOS power switch and when the internal logic actually turns off the switch. During this 100-ns delay, the peak inductor current increases. This increase in inductor current demands a larger saturation current rating for the inductor. This saturation current can be approximated by Equation 2:

$$I_{PK} = I_{CL} + \left(\frac{V_{IN(max)}}{L}\right) 100\ ns \quad (2)$$

Choosing inductors with low ESR decrease power losses and increase efficiency.

Take care when choosing an inductor. For applications that require an input voltage that approaches the output voltage, such as when converting a Li-Ion battery voltage to 5 V, the 400-ns off time may not be enough time to discharge the energy in the inductor and transfer the energy to the output capacitor and load. This can cause a ramping effect in the inductor current waveform and an increased ripple on the output voltage. Using a smaller inductor causes the I_{PK} to increase and increases the output voltage ripple further.

For typical curves and evaluation purposes the DT1608C series inductors from Coilcraft were used. Other acceptable inductors include, but are not limited to, the SLF6020T series from TDK, the NP05D series from Taiyo Yuden, the CDRH4D18 series from Sumida, and the P1166 series from Pulse.

8.2.2.2 Inductor Selection - SEPIC Regulator

Equation 3 can be used to calculate the approximate inductor value for a SEPIC regulator:

$$L2 = 2\left(\frac{V_{OUT} + V_D}{I_{CL}}\right) T_{OFF} \quad (3)$$

The boost inductor, L1, can be smaller or larger but is generally chosen to be the same value as L2. See Figure 23 and Figure 24 for typical SEPIC applications.

8.2.2.3 Diode Selection

To maintain high efficiency, the average current rating of the Schottky diode should be larger than the peak inductor current, I_{PK}. Schottky diodes with a low forward drop and fast switching speeds are ideal for increasing efficiency in portable applications. Choose a reverse breakdown of the Schottky diode larger than the output voltage.

8.2.2.4 Capacitor Selection

Choose low equivalent series resistance (ESR) capacitors for the output to minimize output voltage ripple. Multilayer ceramic capacitors are the best choice. For most applications, a 1-µF ceramic capacitor is sufficient. For some applications a reduction in output voltage ripple can be achieved by increasing the output capacitor. Output voltage ripple can further be reduced by adding a 4.7-pF feed-forward capacitor in the feedback network placed in parallel with RF1 (see *Functional Block Diagram*).

Local bypassing for the input is needed on the LM2705. Multilayer ceramic capacitors are a good choice for this as well. A 4.7-µF capacitor is sufficient for most applications. For additional bypassing, a 100-nF ceramic capacitor can be used to shunt high frequency ripple on the input.

9 Power Supply Recommendations

The LM2705 is designed to operate from an input voltage supply range from 2.2 V to 7 V. This input supply must be well regulated and capable to supply the required input current. If the input supply is located far from the LM2705, additional bulk capacitance may be required in addition to the ceramic bypass capacitors.

10 Layout

10.1 Layout Guidelines

The input bypass capacitor C_{IN}, as shown in Figure 25, must be placed close to the device. This reduces copper trace resistance, which effects input voltage ripple of the LM2705 device. For additional input voltage filtering, a 100-nF bypass capacitor can be placed in parallel with C_{IN} to shunt any high frequency noise to ground. The output capacitor, C_{OUT}, must also be placed close to the device. Any copper trace connections for the C_{OUT} capacitor can increase the series resistance, which directly effects output voltage ripple. Keep the feedback network, resistors R1 and R2, close to the FB pin to minimize copper trace connections that can inject noise into the system. The ground connection for the feedback resistor network must connect directly to an analog ground plane. Tie the analog ground plane directly to the GND pin. If no analog ground plane is available, the ground connection for the feedback network must tie directly to the GND pin. Minimize trace connections made to the inductor and Schottky diode to reduce power dissipation and increase overall efficiency.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

7. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
