

TPS7A7100 1A、快速瞬态响应、低压降稳压器

1 特性

- 低压降：1A 时为 140mV
- V_{IN} 范围：1.5V 至 6.5V
- 可配置的固定 V_{OUT} 范围：0.9V 至 3.5V
- 可调节的 V_{OUT} 范围：0.9V 至 5V
- 非常出色的负载和线路瞬态响应
- 与陶瓷输出电容一起工作时保持稳定
- 1.5%
- 可编程软启动
- 电源正常 (PG) 输出
- 3mm × 3mm QFN-16 和 5mm × 5mm QFN-20 封装

2 应用

- 无线基础设施：串行解串器 (SerDes)、现场可编程门阵列 (FPGA)、数字信号处理器 (DSP)[™]
- 射频 (RF) 组件：压控振荡器 (VCO)、数模转换器 (ADC)、模数转换器 (DAC)、低压差分信号 (LVDS)
- 机顶盒：放大器、ADC、DAC、FPGA、DSP
- 无线局域网 (LAN), *Bluetooth*[®]
- 个人电脑 (PC) 和打印机
- 音频和视频

3 说明

TPS7A7100 低压降 (LDO) 稳压器设计用于追求极低电压降特性的应用 (1A 时为 140mV)，此类应用的输入电压介于 1.5V 至 6.5V 之间。TPS7A7100 提供一种创新的、用户可配置的输出电压设置，范围介于 0.9V 至 3.5V 之间，从而免除了对外部电阻的需要并消除了任何与之相关的误差。

TPS7A7100 具有极快的负载瞬态响应，与陶瓷输出电容器一起工作时保持稳定，并且在线路、负载、和温度上所支持的精度优于 2%。一个软启动引脚使得应用能够减少到负载的涌入电流。此外，一个开漏、电源正常信号可实现电源轨排序。

TPS7A7100 提供 3mm × 3mm、

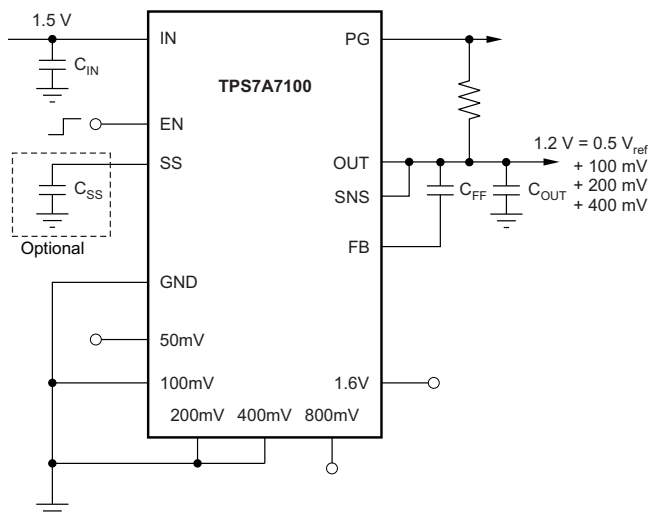

16 引脚 VQFN 和 5mm × 5mm、20 引脚 VQFN 封装。

器件信息⁽¹⁾

器件型号	封装	封装尺寸 (标称值)
TPS7A7100	VQFN (16)	3.00mm × 3.00mm
	超薄四方扁平无引线封装 (VQFN) (20)	5.00mm × 5.00mm

(1) 要了解所有可用封装，请见数据表末尾的可订购产品附录。

典型应用电路

负载瞬态响应 (7 种不同输出)

1.5 V_{IN} 至 1 V_{OUT} , 1.5 V_{IN} 至 1.2 V_{OUT} ,
1.8 V_{IN} 至 1.5 V_{OUT} , 2.5 V_{IN} 至 1.8 V_{OUT} ,
3 V_{IN} 至 2.5 V_{OUT} , 3.3 V_{IN} 至 3 V_{OUT}
以及 5.5 V_{IN} 至 5 V_{OUT}

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision E (September 2013) to Revision F	Page
• 已添加 ESD 额定值表，特性描述部分，器件功能模式，应用和实施部分，电源相关建议部分，布局部分，器件和文档支持部分以及机械、封装和可订购信息部分	1
• Changed name of section from <i>Enable and Shutdown the Device</i> to <i>Enable</i>	21

Changes from Revision C (May 2012) to Revision D	Page
• 将 C _{FF} 电容器添加到首页方框图中	1
• Added text to FB pin description	4
• Added C _{FF} test condition and table note to <i>Electrical Characteristics</i>	7
• Deleted maximum value for Output Current Limit parameter in <i>Electrical Characteristics</i>	7
• Added C _{FF} capacitor to Figure 22	13
• Added C _{FF} capacitor to Figure 23	14
• Added C _{FF} capacitor to Figure 24	15
• Added C _{FF} capacitor to Figure 25	16
• Added C _{FF} capacitor to Figure 26	17
• Added C _{FF} capacitor to Figure 27	18
• Added C _{FF} capacitor to Figure 28	20
• Added C _{FF} capacitor to front page block diagram	23
• Changed capacitor values in first sentence of <i>Output Capacitor Requirements</i> section	24

Changes from Revision B (April 2012) to Revision C	Page
• Added RGT package to Figure 42	28
• Added RGT package to Figure 44	30

Changes from Revision A (March 2012) to Revision B	Page
• 已更改精度特性要点	1
• 已添加 RGT (QFN-16) 封装至 特性	1
• Added RGT package pinout drawing.....	4
• Added RGT package to Pin Descriptions table	4
• Added RGT (QFN-16) package to <i>Thermal Information</i> table.....	6
• Added test conditions for RGT package to <i>Output Voltage Accuracy</i> parameter	7

Changes from Original (March 2012) to Revision A	Page
• 已从“产品预览”改为“量产数据”	1

5 Pin Configurations

Pin Functions

PIN		I/O	DESCRIPTION	
NAME	RGW			RGT
50mV, 100mV, 200mV, 400mV, 800mV, 1.6V	5, 6, 7, 9, 10, 11	4, 5, 6, 8, 9, 10	I	Output voltage setting pins. These pins must be connected to ground or left floating. Connecting these pins to ground increases the output voltage by the value of the pin name; multiple pins can be simultaneously connected to GND to select the desired output voltage. Leave these pins floating (open) when not in use. See the User-Configurable Output Voltage section for more details.
EN	14	12	I	Enable pin. Driving this pin to logic high enables the device; driving the pin to logic low disables the device. See the Enable section for more details.
FB	3	2	I	Output voltage feedback pin. Connected to the error amplifier. See the User-Configurable Output Voltage and Traditional Adjustable Configuration sections for more details. TI highly recommends connecting a 220-pF ceramic capacitor from FB pin to OUT.
GND	8, 18	7	—	Ground pin.
IN	15, 16, 17	13, 14	I	Unregulated supply voltage pin. TI recommends connecting an input capacitor to this pin. See Input Capacitor Requirements for more details.
NC	12	—	—	Not internally connected. The NC pin is not connected to any electrical node. TI strongly recommends connecting this pin and the thermal pad to a large-area ground plane. See the Power Dissipation section for more details.
OUT	1, 19, 20	15, 16	O	Regulated output pin. A 4.7- μ F or larger capacitance is required for stability. See Output Capacitor Requirements for more details.
PG	4	3	O	Active-high power good pin. An open-drain output that indicates when the output voltage reaches 90% of the target. See Power Good for more details.
SNS	2	1	I	Output voltage sense input pin. See the User-Configurable Output Voltage and Traditional Adjustable Configuration sections for more details.
SS	13	11	—	Soft-start pin. Leaving this pin open provides soft start of the default setting. Connecting an external capacitor between this pin and the ground enables the soft-start function by forming an RC-delay circuit in combination with the integrated resistance on the silicon. See the Soft-Start section for more details.
Thermal Pad			—	TI strongly recommends connecting the thermal pad to a large-area ground plane. If available, connect an electrically-floating, dedicated thermal plane to the thermal pad as well.

6 Specifications

6.1 Absolute Maximum Ratings

Over operating junction temperature range (unless otherwise noted).⁽¹⁾

		MIN	MAX	UNIT
Voltage	IN, PG, EN	-0.3	7	V
	SS, FB, SNS, OUT	-0.3	$V_{IN} + 0.3^{(2)}$	V
	50 mV, 100 mV, 200 mV, 400 mV, 800 mV, 1.6 V	-0.3	$V_{OUT} + 0.3^{(2)}$	V
Current	OUT	Internally limited		A
	PG (sink current into IC)		5	mA
Temperature	Operating virtual junction, T_J	-55	160	°C
	Storage, T_{stg}	-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The absolute maximum rating is $V_{IN} + 0.3$ V or +7 V, whichever is smaller.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{IN}	Supply voltage	1.425		6.5	V
V_{OUT}	Output voltage	0.9		5	V
V_{EN}	Enable voltage	0		6.5	V
V_{PG}	Pullup voltage	0		6.5	V
50 mV, 100 mV, 200 mV, 400 mV, 800 mV, 1.6 V	Any-out voltage	0		V_{OUT}	
I_{OUT}	Output current	0		1	A
C_{OUT}	Output capacitance	4.7		200 ⁽¹⁾	μF
C_{FF}	Feedforward capacitance	0		100	nF
T_J	Junction temperature	-40		125	°C

- (1) For output capacitors larger than 47 μF a feedforward capacitor of at least 220 pF must be used.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾⁽²⁾		TPS7A7100 ⁽³⁾		UNIT
		RGW (VQFN)	RGT (VQFN)	
		20 PINS	16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance ⁽⁴⁾	35.7	44.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance ⁽⁵⁾	33.6	54.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance ⁽⁶⁾	15.2	17.2	°C/W
ψ_{JT}	Junction-to-top characterization parameter ⁽⁷⁾	0.4	1.1	°C/W
ψ_{JB}	Junction-to-board characterization parameter ⁽⁸⁾	15.4	17.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance ⁽⁹⁾	3.8	3.8	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) For thermal estimates of this device based on printed-circuit-board (PCB) copper area, see the [TI PCB Thermal Calculator](#).
- (3) Thermal data for the RGW package is derived by thermal simulations based on JEDEC-standard methodology as specified in the JESD51 series. The following assumptions are used in the simulations:
 - (a) i. RGW: The exposed pad is connected to the PCB ground layer through a 4 × 4 thermal via array.
 - ii. RGT: The exposed pad is connected to the PCB ground layer through a 2 × 2 thermal via array.
 - (b) i. RGW: Both the top and bottom copper layers have a dedicated pattern for 4% copper coverage.
 - ii. RGT: Both the top and bottom copper layers have a dedicated pattern for 5% copper coverage.
 - (c) These data were generated with only a single device at the center of a JEDEC high-K (2s2p) board with 3-inch × 3-inch copper area. To understand the effects of the copper area on thermal performance, see the [Power Dissipation](#) and [Estimating Junction Temperature](#) sections.
- (4) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (5) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the top of the package. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (6) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (7) The junction-to-top characterization parameter, ψ_{JT} , estimates the junction temperature of a device in a real system and is extracted from the simulation data to obtain θ_{JA} using a procedure described in JESD51-2a (sections 6 and 7).
- (8) The junction-to-board characterization parameter, ψ_{JB} , estimates the junction temperature of a device in a real system and is extracted from the simulation data to obtain θ_{JA} using a procedure described in JESD51-2a (sections 6 and 7).
- (9) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

6.5 Electrical Characteristics

Over operating temperature range ($T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$), $1.425\text{ V} \leq V_{IN} \leq 6.5\text{ V}$, $V_{IN} \geq V_{OUT(\text{TARGET})} + 0.3\text{ V}$ or $V_{IN} \geq V_{OUT(\text{TARGET})} + 0.5\text{ V}^{(1)(2)}$, OUT connected to $50\ \Omega$ to GND⁽³⁾, $V_{EN} = 1.1\text{ V}$, $C_{OUT} = 10\ \mu\text{F}$, $C_{SS} = 10\text{ nF}$, $C_{FF} = 0\text{ pF}$ (RGW package), $C_{FF} = 220\text{ pF}$ (RGT package)⁽⁴⁾, and PG pin pulled up to V_{IN} with $100\text{ k}\Omega$, $27\text{ k}\Omega \leq R_2 \leq 33\text{ k}\Omega$ for adjustable configuration⁽⁵⁾, unless otherwise noted. Typical values are at $T_J = 25^\circ\text{C}$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IN}	Input voltage		1.425		6.5	V
$V_{(SS)}$	SS pin voltage			0.5		V
V_{OUT}	Output voltage	Adjustable with external feedback resistors	0.9		5	V
		Fixed with voltage setting pins	0.9		3.5	
	Output voltage accuracy ⁽⁶⁾⁽⁷⁾	RGT package only, adjustable, $-40^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$, $25\text{ mA} \leq I_{OUT} \leq 1\text{ A}$	-1.5%		1.5%	
		RGT package only, fixed, $-40^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$, $25\text{ mA} \leq I_{OUT} \leq 1\text{ A}$	-2%		2%	
		Adjustable, $25\text{ mA} \leq I_{OUT} \leq 1\text{ A}$	-2%		2%	
	Fixed, $25\text{ mA} \leq I_{OUT} \leq 1\text{ A}$	-3%		3%		
$\Delta V_{O(\Delta V)}$	Line regulation	$I_{OUT} = 25\text{ mA}$		0.01		%/V
$\Delta V_{O(\Delta I)}$	Load regulation	$25\text{ mA} \leq I_{OUT} \leq 1\text{ A}$		0.1		%/A
$V_{(DO)}$	Dropout voltage ⁽⁸⁾	$V_{OUT} \leq 3.3\text{ V}$, $I_{OUT} = 1\text{ A}$, $V_{(FB)} = \text{GND}$			140	mV
		$3.3\text{ V} < V_{OUT}$, $I_{OUT} = 1\text{ A}$, $V_{(FB)} = \text{GND}$			350	mV
$I_{(LIM)}$	Output current limit	V_{OUT} forced at $0.9 \times V_{OUT(\text{TARGET})}$, $V_{IN} = 3.3\text{ V}$, $V_{OUT(\text{TARGET})} = 0.9\text{ V}$	1.1	1.6		A
$I_{(GND)}$	GND pin current	Full load, $I_{OUT} = 1\text{ A}$		1.8		mA
		Minimum load, $V_{IN} = 6.5\text{ V}$, $V_{OUT(\text{TARGET})} = 0.9\text{ V}$, $I_{OUT} = 25\text{ mA}$			4	mA
		Shutdown, PG = (open), $V_{IN} = 6.5\text{ V}$, $V_{OUT(\text{TARGET})} = 0.9\text{ V}$, $V_{(EN)} < 0.5\text{ V}$		0.1	5	μA
$I_{(EN)}$	EN pin current	$V_{IN} = 6.5\text{ V}$, $V_{(EN)} = 0\text{ V}$ and 6.5 V			± 0.1	μA
$V_{IL(EN)}$	EN pin low-level input voltage (disable device)		0		0.5	V
$V_{IH(EN)}$	EN pin high-level input voltage (enable device)		1.1		6.5	V
$V_{IT(PG)}$	PG pin threshold	For the direction PG \downarrow with decreasing V_{OUT}	$0.85V_{OUT}$	$0.9V_{OUT}$	$0.96V_{OUT}$	V
$V_{hys(PG)}$	PG pin hysteresis	For PG \uparrow		$0.02V_{OUT}$		V
$V_{OL(PG)}$	PG pin low-level output voltage	$V_{OUT} < V_{IT(PG)}$, $I_{PG} = -1\text{ mA}$ (current into device)			0.4	V
$I_{lk(PG)}$	PG pin leakage current	$V_{OUT} > V_{IT(PG)}$, $V_{(PG)} = 6.5\text{ V}$			1	μA
$I_{(SS)}$	SS pin charging current	$V_{(SS)} = \text{GND}$, $V_{IN} = 3.3\text{ V}$	3.5	5.1	7.2	μA
V_n	Output noise voltage	BW = 100 Hz to 100 kHz, $V_{IN} = 1.5\text{ V}$, $V_{OUT} = 1.2\text{ V}$, $I_{OUT} = 1\text{ A}$		39.57		μV_{RMS}
T_{sd}	Thermal shutdown temperature	Shutdown, temperature increasing		160		$^\circ\text{C}$
		Reset, temperature decreasing		140		$^\circ\text{C}$
T_J	Operating junction temperature		-40		125	$^\circ\text{C}$

- (1) When $V_{OUT} \leq 3.5\text{ V}$, $V_{IN} \geq (V_{OUT} + 0.3\text{ V})$ or 1.425 V , whichever is greater; when $V_{OUT} > 3.5\text{ V}$, $V_{IN} \geq (V_{OUT} + 0.5\text{ V})$.
- (2) $V_{OUT(\text{TARGET})}$ is the calculated target V_{OUT} value from the output voltage setting pins: 50 mV, 100 mV, 200 mV, 400 mV, 800 mV, and 1.6 V in fixed configuration, or the expected V_{OUT} value set by external feedback resistors in adjustable configuration.
- (3) This 50- Ω load is disconnected when the test conditions specify an I_{OUT} value.
- (4) C_{FF} is the capacitor between FB pin and OUT.
- (5) R_2 is the bottom-side of the feedback resistor between the FB pin and GND. See for details.
- (6) When the TPS7A7100 is connected to external feedback resistors at the FB pin, external resistor tolerances are not included.
- (7) The TPS7A7100 is not tested at $V_{OUT} = 0.9\text{ V}$, $2.7\text{ V} \leq V_{IN} \leq 6.5\text{ V}$, and $500\text{ mA} \leq I_{OUT} \leq 1\text{ A}$ because the power dissipation is higher than the maximum rating of the package. Also, this accuracy specification does not apply on any application condition that exceeds the power dissipation limit of the package.
- (8) $V_{(DO)}$ is not defined for output voltage settings less than 1.2 V.

6.6 Typical Characteristics

At $T_J = 25^\circ\text{C}$, $V_{IN} = V_{OUT(TARGET)} + 0.3\text{ V}$, $I_{OUT} = 25\text{ mA}$, $V_{(EN)} = V_{IN}$, $C_{IN} = 10\ \mu\text{F}$, $C_{OUT} = 10\ \mu\text{F}$, $C_{(SS)} = 10\ \text{nF}$, and the PG pin pulled up to V_{IN} with 100-k Ω pullup resistor, unless otherwise noted.

7 Detailed Description

7.1 Overview

The TPS7A7100 belongs to a family of new-generation LDO regulators that uses innovative circuitry to offer very low dropout voltage along with the flexibility of a programmable output voltage.

The dropout voltage for this LDO regulator family is 0.14 V at 1 A. This voltage is ideal for making the TPS7A7100 into a point-of-load (POL) regulator because 0.14 V at 1 A is lower than any voltage gap among the most common voltage rails: 1.2 V, 1.5 V, 1.8 V, 2.5 V, 3 V, and 3.3 V. This device offers a fully user-configurable output voltage setting method. The TPS7A7100 output voltage can be programmed to any target value from 0.9 V to 3.5 V in 50-mV steps.

Another big advantage of using the TPS7A7100 is the wide range of available operating input voltages: from 1.5 V to 6.5 V. The TPS7A7100 also has very good line and load transient response. All these features allow the TPS7A7100 to meet most voltage-regulator needs for under 6-V applications, using only one device so less time is spent on inventory control.

Texas Instruments also offers different output current ratings with other family devices: the [TPS7A7200](#) (2 A) and [TPS7A7300](#) (3 A).

7.2 Functional Block Diagram

NOTE: 32R = 1.024 MΩ (that is, 1R = 32 kΩ).

7.3 Feature Description

7.3.1 User-Configurable Output Voltage

Unlike traditional LDO devices, the TPS7A7100 comes with only one orderable part number. There is no adjustable or fixed output voltage option. The output voltage of the TPS7A7100 is selectable in accordance with the names given to the output voltage setting pins: 50 mV, 100 mV, 200 mV, 400 mV, 800 mV, and 1.6 V. For each pin connected to the ground, the output voltage setting increases by the value associated with that pin name, starting from the value of the reference voltage of 0.5 V. Floating the pins has no effect on the output voltage. Figure 22 through Figure 27 show examples of how to program the output voltages.

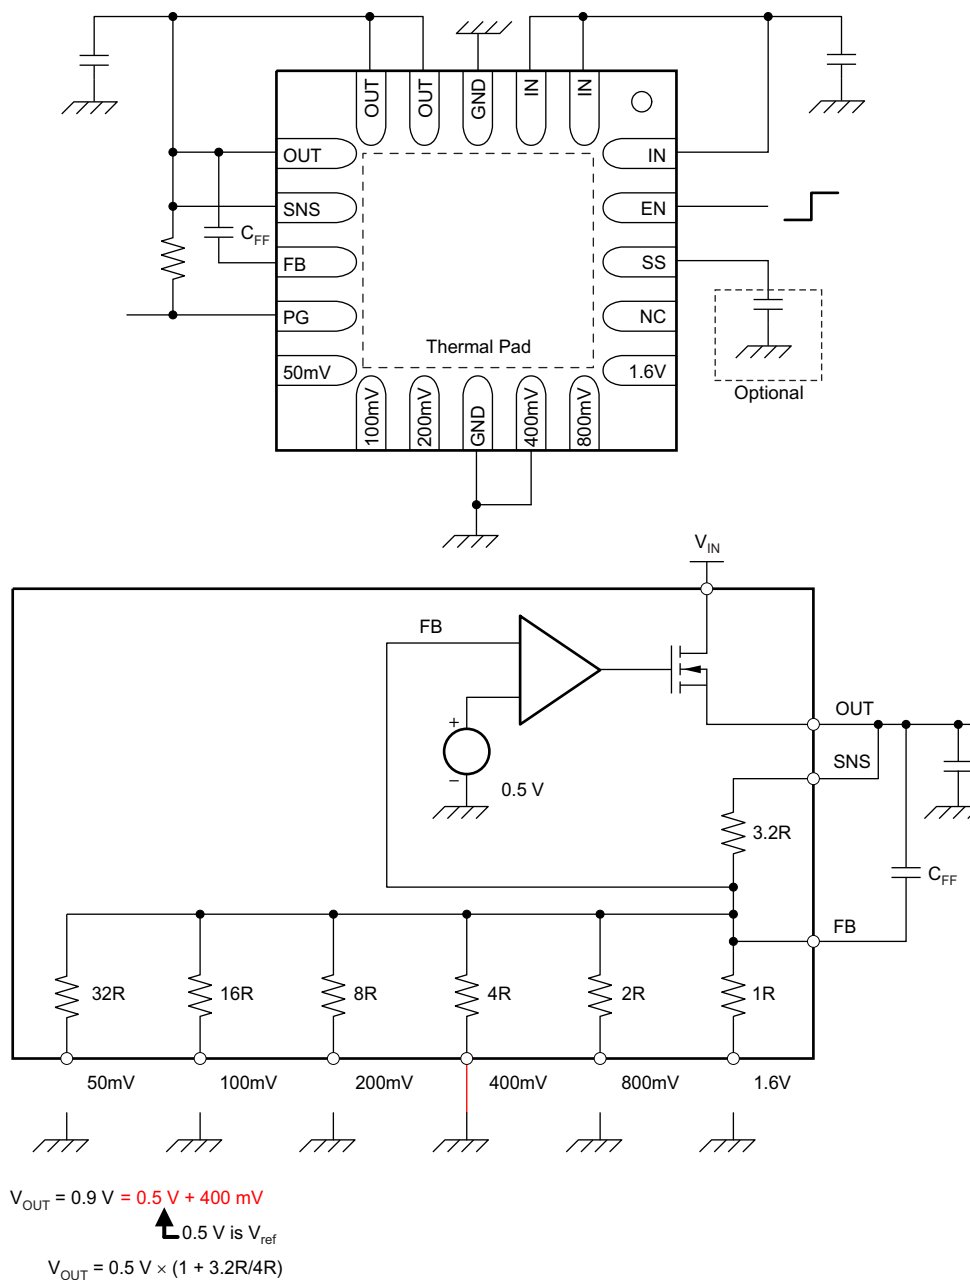

Figure 22. 0.9-V Configuration

Feature Description (continued)

$$V_{OUT} = 1.2\text{ V} = 0.5\text{ V} + 100\text{ mV} + 200\text{ mV} + 400\text{ mV}$$

0.5 V is V_{ref}

$$V_{OUT} = 0.5\text{ V} \times (1 + 3.2R/2.29R) \quad 2.29R \text{ is parallel resistance of } 16R, 8R, \text{ and } 4R.$$

Figure 23. 1.2-V Configuration

Feature Description (continued)

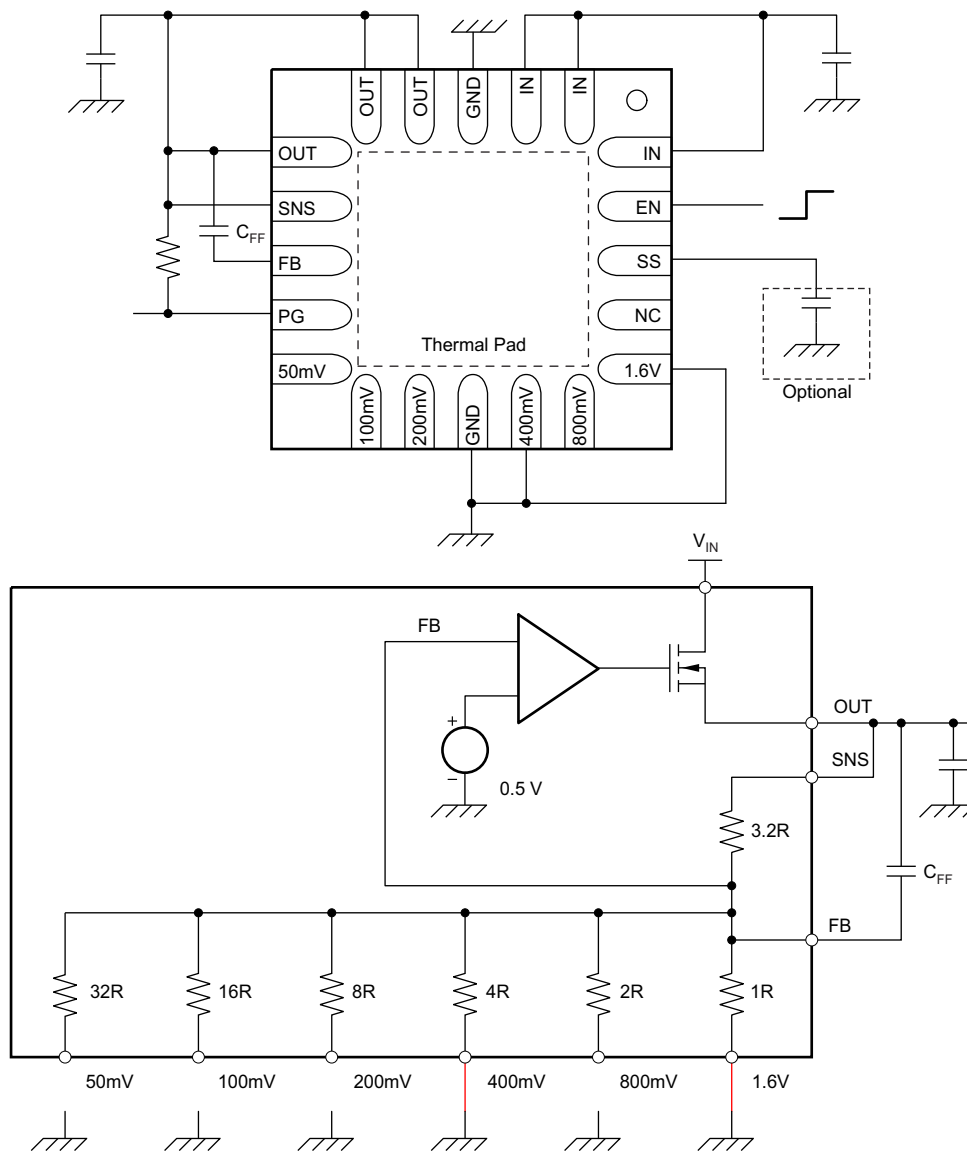

$$V_{OUT} = 1.8\text{ V} = 0.5\text{ V} + 100\text{ mV} + 400\text{ mV} + 800\text{ mV}$$

0.5 V is V_{ref}

$$V_{OUT} = 0.5\text{ V} \times (1 + 3.2R/1.23R) \quad 1.23R \text{ is parallel resistance of } 16R, 4R, \text{ and } 2R.$$

Figure 24. 1.8-V Configuration

Feature Description (continued)

$$V_{OUT} = 2.5\text{ V} = 0.5\text{ V} + 400\text{ mV} + 1.6\text{ V}$$

0.5 V is V_{ref}

$$V_{OUT} = 0.5\text{ V} \times (1 + 3.2R/0.8R) \quad 0.8R \text{ is parallel resistance of } 4R \text{ and } 1R.$$

Figure 25. 2.5-V Configuration

Feature Description (continued)

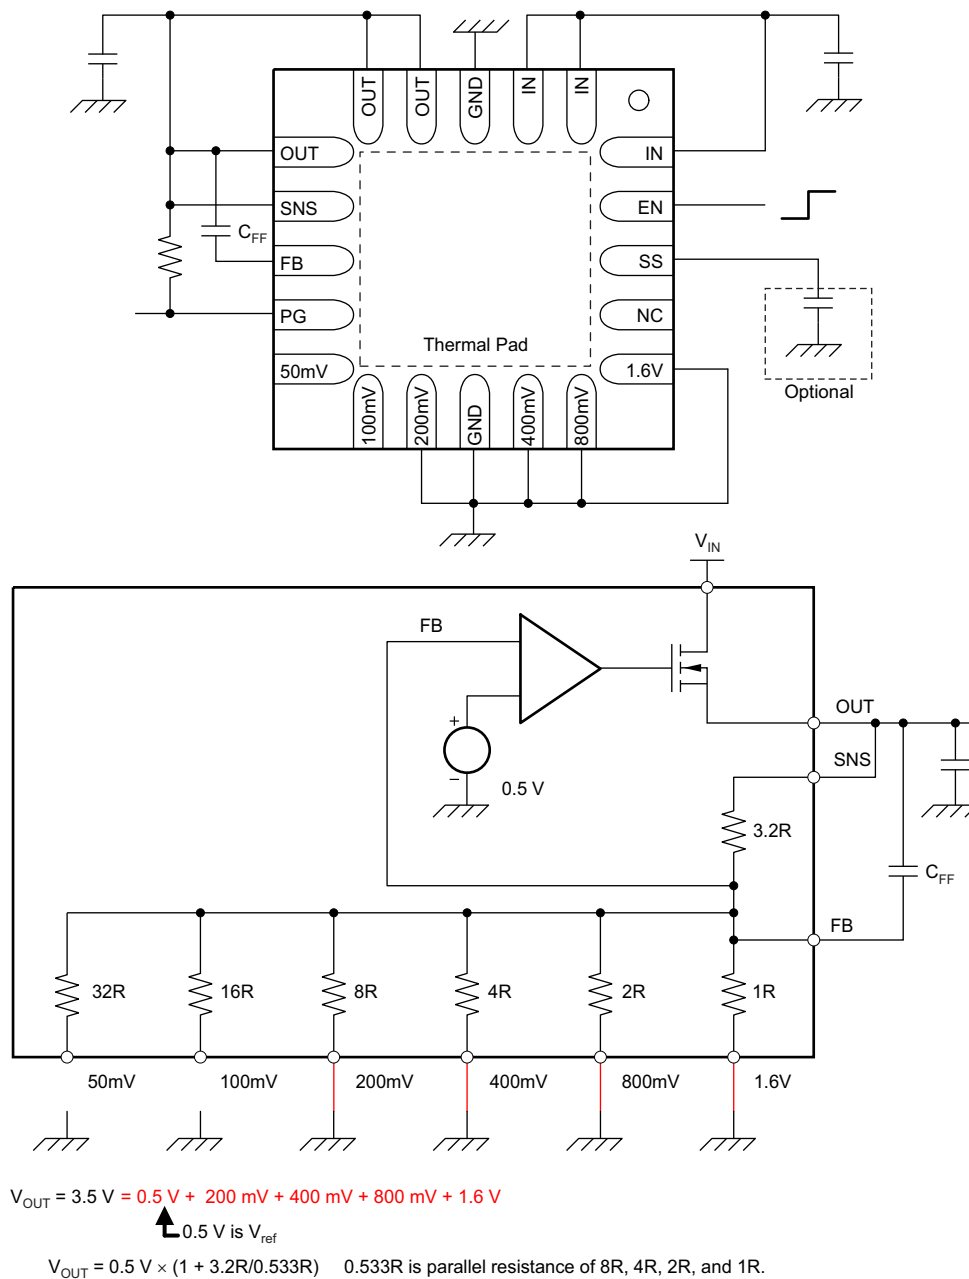

$$V_{OUT} = 3.3\text{ V} = 0.5\text{ V} + 400\text{ mV} + 800\text{ mV} + 1.6\text{ V}$$

0.5 V is V_{ref}

$$V_{OUT} = 0.5\text{ V} \times (1 + 3.2R/0.571R) \quad 0.571R \text{ is parallel resistance of } 4R, 2R, \text{ and } 1R.$$

Figure 26. 3.3-V Configuration

Feature Description (continued)

Figure 27. 3.5-V Configuration

See [Table 1](#) for a full list of target output voltages and corresponding pin settings. The voltage setting pins have a binary weight; therefore, the output voltage can be programmed to any value from 0.9 V to 3.5 V in 50-mV steps.

[Figure 11](#) and [Figure 12](#) show this output voltage programming performance.

Feature Description (continued)
NOTE

Any output voltage setting that is not listed in [Table 1](#) is not covered in . For output voltages greater than 3.5 V, use a traditional adjustable configuration (see the [Traditional Adjustable Configuration](#) section).

7.3.2 Traditional Adjustable Configuration

For any output voltage target that is not supported in the *User-Configurable Output Voltage* section, a traditional adjustable configuration with external-feedback resistors can be used with the TPS7A7100. shows how to configure the TPS7A7100 as an adjustable regulator with an equation and Table 2 lists recommended pairs of feedback resistor values.

NOTE

The bottom side of feedback resistor R2 in must be in the range of 27 kΩ to 33 kΩ to maintain the specified regulation accuracy.

Figure 28. Traditional Adjustable Configuration With External Resistors

Table 2. Recommended Feedback-Resistor Values

V _{OUT(TARGET)} (V)	E96 SERIES		R40 SERIES	
	R1 (kΩ)	R2 (kΩ)	R1 (kΩ)	R2 (kΩ)
1	30.1	30.1	30	30
1.2	39.2	28	43.7	31.5
1.5	61.9	30.9	60	30

3	147	29.4	150	30
3.3	165	29.4	175	31.5
5	280	30.9	243	27.2

7.3.3 Undervoltage Lockout (UVLO)

The TPS7A7100 uses an undervoltage lockout circuit to keep the output shut off until the internal circuitry is operating properly. The UVLO circuit has a deglitch feature that typically ignores undershoot of the input voltage upon the event of device start-up. Still, a poor input line impedance may cause a severe input voltage drop when the device powers on. As explained in the [Input Capacitor Requirements](#) section, the input line impedance must be well-designed.

7.3.4 Soft-Start

The TPS7A7100 has an SS pin that provides a soft-start (slow start) function.

By leaving the SS pin open, the TPS7A7100 performs a soft-start by its default setting.

As shown in [Functional Block Diagram](#), by connecting a capacitor between the SS pin and the ground, the C_{SS} capacitor forms an RC pair together with the integrated 50-k Ω resistor. The RC pair operates as an RC-delay circuit for the soft-start together with the internal 700- μ s delay circuit.

The relationship between C_{SS} and the soft-start time is shown in through .

7.3.5 Current Limit

The TPS7A7100 internal current limit circuitry protects the regulator during fault conditions. During a current limit event, the output sources a fixed amount of current that is mostly independent of the output voltage. The current limit function is provided as a fail-safe mechanism and is not intended to be used regularly. Do **not** design any applications to use this current limit function as a part of expected normal operation. Extended periods of current limit operation degrade device reliability.

Powering on the device with the enable pin, or increasing the input voltage above the minimum operating voltage while a low-impedance short exists on the output of the device, may result in a sequence of high-current pulses from the input to the output of the device. The energy consumed by the device is minimal during these events; therefore, there is no failure risk. Additional input capacitance helps to mitigate the load transient requirement of the upstream supply during these events.

7.3.6 Enable

The EN pin switches the enable and disable (shutdown) states of the TPS7A7100. A logic high input at the EN pin enables the device; a logic low input disables the device. When disabled, the device current consumption is reduced.

7.3.7 Power Good

The TPS7A7100 has a power good function that works with the PG output pin. When the output voltage undershoots the threshold voltage $V_{IT(PG)}$ during normal operation, the PG open-drain output turns from a high-impedance state to a low-impedance state. When the output voltage exceeds the $V_{IT(PG)}$ threshold by an amount greater than the PG hysteresis, $V_{hys(PG)}$, the PG open-drain output turns from a low-impedance state to high-impedance state. By connecting a pullup resistor (usually between OUT and PG pins), any downstream device can receive an active-high enable logic signal.

When setting the output voltage to less than 1.8 V and using a pullup resistor between OUT and PG pins, depending on the downstream device specifications, the downstream device may not accept the PG output as a valid high-level logic voltage. In such cases, place a pullup resistor between IN and PG pins, not between OUT and PG pins.

[Figure 18](#) shows the open-drain output drive capability. The on-resistance of the open-drain transistor is calculated using [Figure 18](#), and is approximately 200 Ω . Any pullup resistor greater than 10 k Ω works fine for this purpose.

7.4 Device Functional Modes

7.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage is at least as high as $V_{IN(MIN)}$.
- The input voltage is greater than the nominal output voltage added to the dropout voltage.
- The enable voltage has previously exceeded the enable rising threshold voltage and has not decreased below the enable falling threshold.
- The output current is less than the current limit.
- The device junction temperature is less than the maximum specified junction temperature.

7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this mode of operation, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device (such as a bipolar junction transistor, or BJT) is in saturation and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

7.4.3 Disabled

The device is disabled under the following conditions:

- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.

[Table 3](#) lists the conditions that lead to the different modes of operation.

Table 3. Device Functional Mode Comparison

OPERATING MODE	PARAMETER			
	V_{IN}	V_{EN}	I_{OUT}	T_J
Normal mode	$V_{IN} > V_{OUT(NOM)} + V_{DO}$ and $V_{IN} > V_{IN(MIN)}$	$V_{EN} > V_{IH(EN)}$	$I_{OUT} < I_{(LIM)}$	$T_J < 125^{\circ}\text{C}$
Dropout mode	$V_{IN} < V_{OUT(NOM)} + V_{DO}$	$V_{EN} > V_{IH(EN)}$	—	$T_J < 125^{\circ}\text{C}$
Disabled mode (any true condition disables the device)	—	$V_{EN} < V_{IL(EN)}$	—	$T_J > 160^{\circ}\text{C}$

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS7A7100 is a very-low dropout LDO with very fast load transient response. The TPS7A7100 provides a number of features such as a power good signal for output monitoring, a soft-start pin to reduce inrush currents during start-up, and it is suitable for applications that require up to 3 A of output current.

8.2 Typical Application

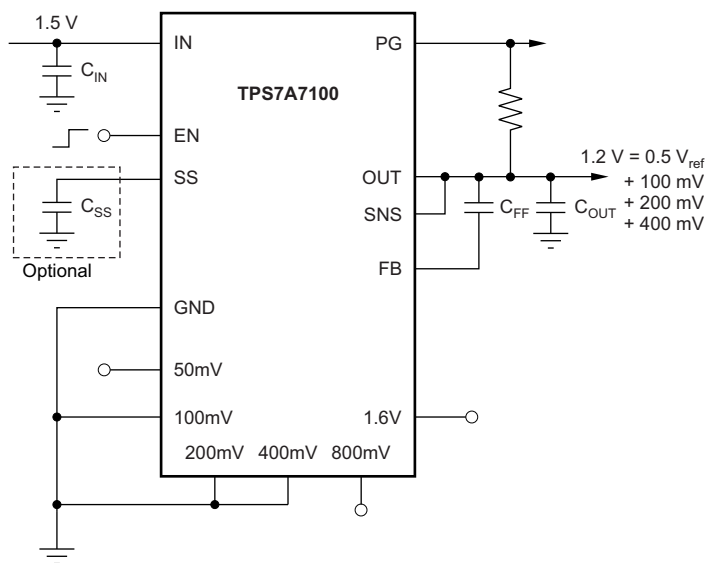

Figure 29. 1.2-V Output Using ANY-OUT Pins

8.2.1 Design Requirements

Table 4 lists the design parameters for this example.

Table 4. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	1.425 V to 6.5 V
Output voltage	1.2 V
Output current rating	3 A
Output capacitor range	4.7 μ F to 200 μ F
feedforward capacitor range	220 pF to 100 nF
Soft-Start capacitor range	0 to 1 μ F

8.2.2 Detailed Design Procedure

8.2.2.1 ANY-OUT Programmable Output Voltage

For ANY-OUT operation, the TPS7A7001 does not use any external resistors to set the output voltage, but uses device pins labeled 50 mV, 100 mV, 200 mV, 400 mV, 800 mV, and 1.6 V to set the regulated output voltage. Each pin is either connected to ground (active) or is left open (floating). The ANY-OUT programming is set as the sum of the internal reference voltage ($V_{(SS)} = 0.5 \text{ V}$) plus the sum of the respective voltages assigned to each active pin. By leaving all ANY-OUT pins open, or floating, the output is set to the minimum possible output voltage equal to $V_{(SS)}$. By grounding all of the ANY-OUT pins, the output is set to 3.65 V.

When using the ANY-OUT pins, the SNS pin must always be connected between the OUT and FB pins. However, the feedforward capacitor must be connected to the FB pin, not the SNS pin.

8.2.2.2 Traditional Adjustable Output Voltage

For applications that need the regulated output voltage to be greater than 3.65 V (or those that require more resolution than the 50 mV that the ANY-OUT pins provide), the TPS7A7100 can also be use the traditional adjustable method of setting the regulated output.

When using the traditional method of setting the output, the FB pin must be connected to the node connecting the top and bottom resistors of the resistor divider. The SNS pin must be left floating.

8.2.2.3 Input Capacitor Requirements

As a result of its very fast transient response and low-dropout operation support, it is necessary to reduce the line impedance at the input pin of the TPS7A7100. The line impedance depends heavily on various factors, such as wire (PCB trace) resistance, wire inductance, and output impedance of the upstream voltage supply (power supply to the TPS7A7100). Therefore, a specific value for the input capacitance cannot be recommended until the previously listed factors are finalized.

In addition, simple usage of large input capacitance can form an unwanted LC resonance in combination with input wire inductance. For example, a 5-nH inductor and a 10- μF input capacitor form an LC filter that has a resonance at 712 kHz. This value of 712 kHz is well inside the bandwidth of the TPS7A7100 control loop.

The best guideline is to use a capacitor of up to 1 μF with well-designed wire connections (PCB layout) to the upstream supply. If it is difficult to optimize the input line, use a large tantalum capacitor in combination with a good-quality, low-ESR, 1- μF ceramic capacitor.

8.2.2.4 Output Capacitor Requirements

The TPS7A7100 is designed to be stable with standard ceramic capacitors with capacitance values from 4.7 μF to 47 μF without a feedforward capacitor. For output capacitors from 47 μF to 200 μF a feedforward capacitor of at least 220 pF must be used. The TPS7A7100 is evaluated using an X5R-type, 10- μF ceramic capacitor. TI highly recommends the X5R- and X7R-type capacitors because they have minimal variation in value and ESR over temperature. Maximum ESR must be less than 1 Ω .

As with any regulator, increasing the size of the output capacitor reduces overshoot and undershoot magnitude, but increases duration of the transient response.

9 Power Supply Recommendations

This device is designed for operation from an input voltage supply ranging from 1.425 V to 6.5 V. This input supply must be well regulated. The TPS7A7100 family of fast-transient, low-dropout linear regulators achieve stability with a minimum output capacitance of 4.7 μF ; however, TI recommends using 10- μF ceramic capacitors for both the input and output to maximize AC performance.

10 Layout

10.1 Layout Guidelines

- To improve AC performance such as PSRR, output noise, and transient response, TI recommends designing the board with separate ground planes for IN and OUT, with each ground plane connected only at the GND pin of the device.
- In addition, the ground connection for the output capacitor must connect directly to the GND pin of the device.
- Equivalent series inductance (ESL) and ESR must be minimized to maximize performance and ensure stability.
- Every capacitor must be placed as close as possible to the device and on the same side of the PCB as the regulator itself.
- Do **not** place any of the capacitors on the opposite side of the PCB from where the regulator is installed.
- The use of vias and long traces is strongly discouraged because they may impact system performance negatively and even cause instability.
- If possible, and to ensure the maximum performance denoted in this product data sheet, use the same layout pattern used for the TPS7A7100 evaluation board, [SLAU430](#).

10.2 Layout Example

Notes: C_{in} and C_{out} are 0805 packages
 C_{SS} , R_1 , and R_2 are 0402 packages
 R_1 and R_2 only needed for adjustable operation
 ○ Denotes a via to a connection made on another layer

Figure 41. TPS7A7100 Recommended Layout

10.3 Thermal Considerations

The thermal protection feature disables the output when the junction temperature rises to approximately 160°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal-protection circuit may cycle on and off. This thermal limit protects the device from damage as a result of overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature must be limited to 125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection must trigger at least 35°C above the maximum expected ambient condition of your particular application. This configuration produces a worst-case junction temperature of 125°C at the highest-expected ambient temperature and worst-case load.

The internal-protection circuitry of the TPS7A7100 has been designed to protect against overload conditions. It was not intended to replace proper heatsinking. Continuously running the TPS7A7100 into thermal shutdown degrades device reliability.

10.4 Power Dissipation

Knowing the device power dissipation and proper sizing of the thermal plane that is connected to the tab or pad is critical to avoiding thermal shutdown and ensuring reliable operation.

Power dissipation of the device depends on input voltage and load conditions and can be calculated using [Equation 1](#):

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (1)$$

Power dissipation can be minimized and greater efficiency can be achieved by using the lowest possible input voltage necessary to achieve the required output voltage regulation.

On the VQFN (RGW or RGT) package, the primary conduction path for heat is through the exposed pad to the PCB. The pad can be connected to ground or be left floating; however, it must be attached to an appropriate amount of copper PCB area to ensure the device does not overheat. The maximum junction-to-ambient thermal resistance depends on the maximum ambient temperature, maximum device junction temperature, and power dissipation of the device and can be calculated using [Equation 2](#):

$$R_{\theta JA} = \left(\frac{+125^\circ\text{C} - T_A}{P_D} \right) \quad (2)$$

Knowing the maximum $R_{\theta JA}$, the minimum amount of PCB copper area needed for appropriate heatsinking can be estimated using [Figure 42](#).

Figure 42. θ_{JA} vs Board Size

Power Dissipation (continued)

Figure 42 shows the variation of θ_{JA} as a function of ground plane copper area in the board. It is intended only as a guideline to demonstrate the effects of heat spreading in the ground plane and must not be used to estimate actual thermal performance in real application environments.

NOTE

When the device is mounted on an application PCB, TI strongly recommends using Ψ_{JT} and Ψ_{JB} , as explained in the [Estimating Junction Temperature](#) section.

10.5 Estimating Junction Temperature

Using the thermal metrics Ψ_{JT} and Ψ_{JB} , as shown in the [Thermal Information](#) table, the junction temperature can be estimated with corresponding formulas (given in [Equation 3](#)). For backwards compatibility, an older $\theta_{JC, Top}$ parameter is listed as well.

$$\Psi_{JT}: T_J = T_T + \Psi_{JT} \cdot P_D$$

$$\Psi_{JB}: T_J = T_B + \Psi_{JB} \cdot P_D$$

Where:

P_D is the power dissipation shown by [Equation 2](#).

T_T is the temperature at the center-top of the IC package.

T_B is the PCB temperature measured 1 mm away from the IC package *on the PCB surface* (see [Figure 43](#)). (3)

NOTE

Both T_T and T_B can be measured on actual application boards using a thermo-gun (an infrared thermometer).

For more information about measuring T_T and T_B , see the Application Report [SBVA025](#), *Using New Thermal Metrics*.

(a) Example RGW (QFN) Package Measurement

Figure 43. Measuring Points For T_T And T_B

Estimating Junction Temperature (continued)

By looking at [Figure 44](#), the new thermal metrics (Ψ_{JT} and Ψ_{JB}) have very little dependency on board size. That is, using Ψ_{JT} or Ψ_{JB} with [Equation 3](#) is a good way to estimate T_J by simply measuring T_T or T_B , regardless of the application board size.

Figure 44. Ψ_{JT} And Ψ_{JB} vs Board Size

For a more detailed discussion of why TI does not recommend using $\theta_{JC(top)}$ to determine thermal characteristics, see Application Report [SBVA025](#), *Using New Thermal Metrics*. For further information, see Application Report [SPRA953](#), *Semiconductor and IC Package Thermal Metrics*.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

RGW (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flat pack, No-leads (QFN) package configuration
 - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - F. Falls within JEDEC MO-220.

THERMAL PAD MECHANICAL DATA

RGW (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - F. Customers should contact their board fabrication site for solder mask tolerances.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要声明

德州仪器 (TI) 公司有权按照最新发布的 JESD46 对其半导体产品和服务进行纠正、增强、改进和其他修改，并不再按最新发布的 JESD48 提供任何产品和服务。买方在下订单前应获取最新的相关信息，并验证这些信息是否完整且是最新的。

TI 公布的半导体产品销售条款 (<http://www.ti.com/sc/docs/stdterms.htm>) 适用于 TI 已认证和批准上市的已封装集成电路产品的销售。另有其他条款可能适用于其他类型 TI 产品及服务的使用或销售。

复制 TI 数据表上 TI 信息的重要部分时，不得变更该等信息，且必须随附所有相关保证、条件、限制和通知，否则不得复制。TI 对该等复制文件不承担任何责任。第三方信息可能受到其它限制条件的制约。在转售 TI 产品或服务时，如果存在对产品或服务参数的虚假陈述，则会失去相关 TI 产品或服务的明示或暗示保证，且构成不公平的、欺诈性商业行为。TI 对此类虚假陈述不承担任何责任。

买方和在系统中整合 TI 产品的其他开发人员（总称“设计人员”）理解并同意，设计人员在设计应用时应自行实施独立的分析、评价和判断，且应全权负责并确保应用的安全性，及设计人员的应用（包括应用中使用的 TI 产品）应符合所有适用的法律法规及其他相关要求。设计人员就自己设计的应用声明，其具备制订和实施下列保障措施所需的一切必要专业知识，能够 (1) 预见故障的危险后果，(2) 监视故障及其后果，以及 (3) 降低可能导致危险的故障几率并采取适当措施。设计人员同意，在使用或分发包含 TI 产品的任何应用前，将彻底测试该等应用和该等应用中所用 TI 产品的功能。

TI 提供技术、应用或其他设计建议、质量特点、可靠性数据或其他服务或信息，包括但不限于与评估模块有关的参考设计和材料（总称“TI 资源”），旨在帮助设计人员开发整合了 TI 产品的应用，如果设计人员（个人，或如果是代表公司，则为设计人员的公司）以任何方式下载、访问或使用任何特定的 TI 资源，即表示其同意仅为该等目标，按照本通知的条款使用任何特定 TI 资源。

TI 所提供的 TI 资源，并未扩大或以其他方式修改 TI 对 TI 产品的公开适用的质保及质保免责声明；也未导致 TI 承担任何额外的义务或责任。TI 有权对其 TI 资源进行纠正、增强、改进和其他修改。除特定 TI 资源的公开文档中明确列出的测试外，TI 未进行任何其他测试。

设计人员只有在开发包含该等 TI 资源所列 TI 产品的应用时，才被授权使用、复制和修改任何相关 TI 资源。但并未依据禁止反言原则或其他法律授予您任何 TI 知识产权的任何其他明示或暗示的许可，也未授予您 TI 或第三方的任何技术或知识产权的许可，该等许可包括但不限于任何专利权、版权、屏蔽作品权或与美国 TI 产品或服务的任何整合、机器制作、流程相关的其他知识产权。涉及或参考了第三方产品或服务的信息不构成使用此类产品或服务的许可或与其相关的保证或认可。使用 TI 资源可能需要您向第三方获得对该等第三方专利或其他知识产权的许可。

TI 资源系“按原样”提供。TI 兹免除对资源及其使用作出所有其他明确或默示的保证或陈述，包括但不限于对准确性或完整性、产权保证、无屡发故障保证，以及适销性、适合特定用途和不侵犯任何第三方知识产权的任何默认保证。TI 不负责任何申索，包括但不限于因组合产品所致或与之有关的申索，也不为或对设计人员进行辩护或赔偿，即使该等产品组合已列于 TI 资源或其他地方。对因 TI 资源或其使用引起或与之有关的任何实际的、直接的、特殊的、附带的、间接的、惩罚性的、偶发的、从属或惩戒性损害赔偿，不管 TI 是否获悉可能会产生上述损害赔偿，TI 概不负责。

除 TI 已明确指出特定产品已达到特定行业标准（例如 ISO/TS 16949 和 ISO 26262）的要求外，TI 不对未达到任何该等行业标准要求而承担任何责任。

如果 TI 明确宣称产品有助于功能安全或符合行业功能安全标准，则该等产品旨在帮助客户设计和创作自己的符合相关功能安全标准和要求的的应用。在应用内使用产品的行为本身不会配有安全特性。设计人员必须确保遵守适用于其应用的相关安全要求和标准。设计人员不可将任何 TI 产品用于关乎性命的医疗设备，除非已由各方获得授权的管理人员签署专门的合同对此类应用专门作出规定。关乎性命的医疗设备是指出现故障会导致严重身体伤害或死亡的医疗设备（例如生命保障设备、心脏起搏器、心脏除颤器、人工心脏泵、神经刺激器以及植入设备）。此类设备包括但不限于，美国食品药品监督管理局认定为 III 类设备的设备，以及在美国以外的其他国家或地区认定为同等类别设备的所有医疗设备。

TI 可能明确指定某些产品具备某些特定资格（例如 Q100、军用级或增强型产品）。设计人员同意，其具备一切必要专业知识，可以为自己的应用选择适合的产品，并且正确选择产品的风险由设计人员承担。设计人员单方面负责遵守与该等选择有关的所有法律或监管要求。

设计人员同意向 TI 及其代表全额赔偿因其不遵守本通知条款和条件而引起的任何损害、费用、损失和/或责任。
