

UCC2721x 120-V Boot, 4-A Peak, High-Frequency High-Side and Low-Side Driver

1 Features

- Drives Two N-Channel MOSFETs in High-Side and Low-Side Configuration With Independent Inputs
- Maximum Boot Voltage 120-V DC
- 4-A Sink, 4-A Source Output Currents
- 0.9- Ω Pullup and Pulldown Resistance
- Input Pins Can Tolerate -10 V to 20 V and Are Independent of Supply Voltage Range
- TTL or Pseudo-CMOS Compatible Input Versions
- 8-V to 17-V VDD Operating Range, (20-V Absolute Maximum)
- 7.2-ns Rise and 5.5-ns Fall Time With 1000-pF Load
- Fast Propagation Delay Times (18 ns Typical)
- 2-ns Delay Matching
- Symmetrical Undervoltage Lockout for High-Side and Low-Side Driver
- All Industry Standard Packages Available (SOIC-8, PowerPAD™ SOIC-8, 4-mm x 4-mm SON-8 and 4-mm x 4-mm SON-10)
- Specified from -40 to 140 °C

2 Applications

- Power Supplies for Telecom, Datacom, and Merchant
- Half-Bridge and Full-Bridge Converters
- Push-Pull Converters
- High-Voltage Synchronous-Buck Converters
- Two-Switch Forward Converters
- Active-Clamp Forward Converters
- Class-D Audio Amplifiers

3 Description

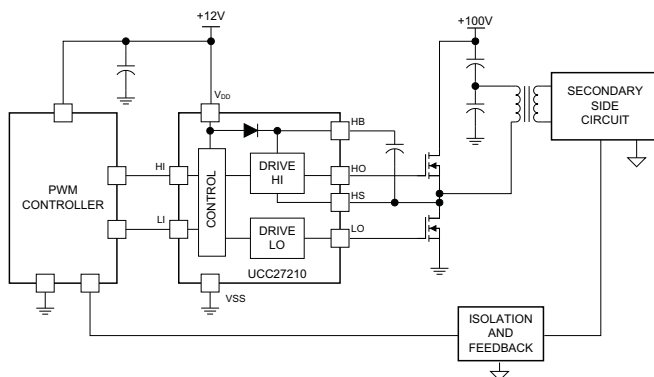

The UCC27210 and UCC27211 drivers are based on the popular UCC27200 and UCC27201 MOSFET drivers, but offer several significant performance improvements. Peak output pull-up and pull-down current has been increased to 4-A source and 4-A sink, and pull-up and pull-down resistance have been reduced to 0.9 Ω , thereby allowing for driving large power MOSFETs with minimized switching losses during the transition through the Miller Plateau of the MOSFET. The input structure is now able to directly handle -10 VDC, which increases robustness and also allows direct interface to gate-drive transformers without using rectification diodes. The inputs are also independent of supply voltage and have a maximum rating of 20-V.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
UCC27210, UCC27211	SOIC (8)	4.90 mm x 3.91 mm
	PowerPAD (8)	4.89 mm x 3.90 mm
	WSON (10)	4.00 mm x 4.00 mm
	VSON (8)	

(1) For all available packages, see the orderable addendum at the end of the datasheet.

Typical Application: UCC27210

Typical Application: UCC27211

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (August 2013) to Revision F

Page

- Added *Pin Configuration and Functions* section, *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section **1**

Changes from Revision D (November, 2012) to Revision E

Page

- Added Note 2 to the Terminal Functions Table..... **5**
- Changed Repetitive pulse data from -18 V to -(24V-VDD). **5**
- Added additional details to Note 2..... **5**
- Changed Voltage on HS, V_{HS} (repetitive pulse <100 ns) data from -15 to -(24V-VDD)..... **6**
- Deleted 2.4-mA operating current min range in both places..... **7**
- Changed operating current max range extended to 5.2 in both places. **7**
- Deleted 1.5 min Boot voltage operating current range..... **7**
- Changed Boot voltage operating current max range from 4.2 to 5.0. **7**
- Changed HB to V_{SS} operating current max range from 1.1 to 1.2. **7**
- Changed LO Gate Driver's Low-level output voltage max range from 0.17 to 0.19..... **7**
- Changed HO GATE Driver's Low-level output voltage max range from 0.17 to 0.19. **7**

Changes from Revision C (March, 2012) to Revision D

Page

- Changed capacitor range from 1.0 μ F to 4.7 μ F. **5**
- Added Terminal Functions Note to HI and LI pin description..... **5**
- Changed bullet 2 in the Layout Recommendations. **21**
- Added Note: For systems using... .. **21**

- Added Note: Care should be taken... 21

Changes from Revision B (February) to Revision C	Page
• Changed V_{DD} operating current max range of 4.3 to 4.4 in both places.	7
• Changed Boot voltage operating current max range from 4.0 to 4.2.	7
• Changed HB to V_{SS} quiescent current max range from 0.13 to 1.0.	7
• Changed HB to V_{SS} operating current max range from 0.9 to 1.1.	7
• Added Input UCC27210/11 (DDA Only) values.	7
• Added Under-Voltage Lockout (UVLO) DDA only values, two places.	7
• Changed LO Gate Driver's Low-level output voltage max range from 0.15 to 0.17.	7
• Changed LO Gate Driver's V_{LOH} max range from 0.27 to 0.29.	7
• Changed HO GATE Driver's Low-level output voltage max range from 0.15 to 0.17.	7
• Changed V_{LI} falling to V_{LO} falling min value from 17 to 15.	8
• Changed V_{HI} falling to V_{HO} falling min value from 17 to 15.	8
• Changed V_{LI} rising to V_{LO} rising min value from 18 to 15.	8
• Changed V_{HI} rising to V_{HO} rising min value from 18 to 15.	8
• Changed Figure 17, Output Current vs. Output Voltage.	12

5 Description (Continued)

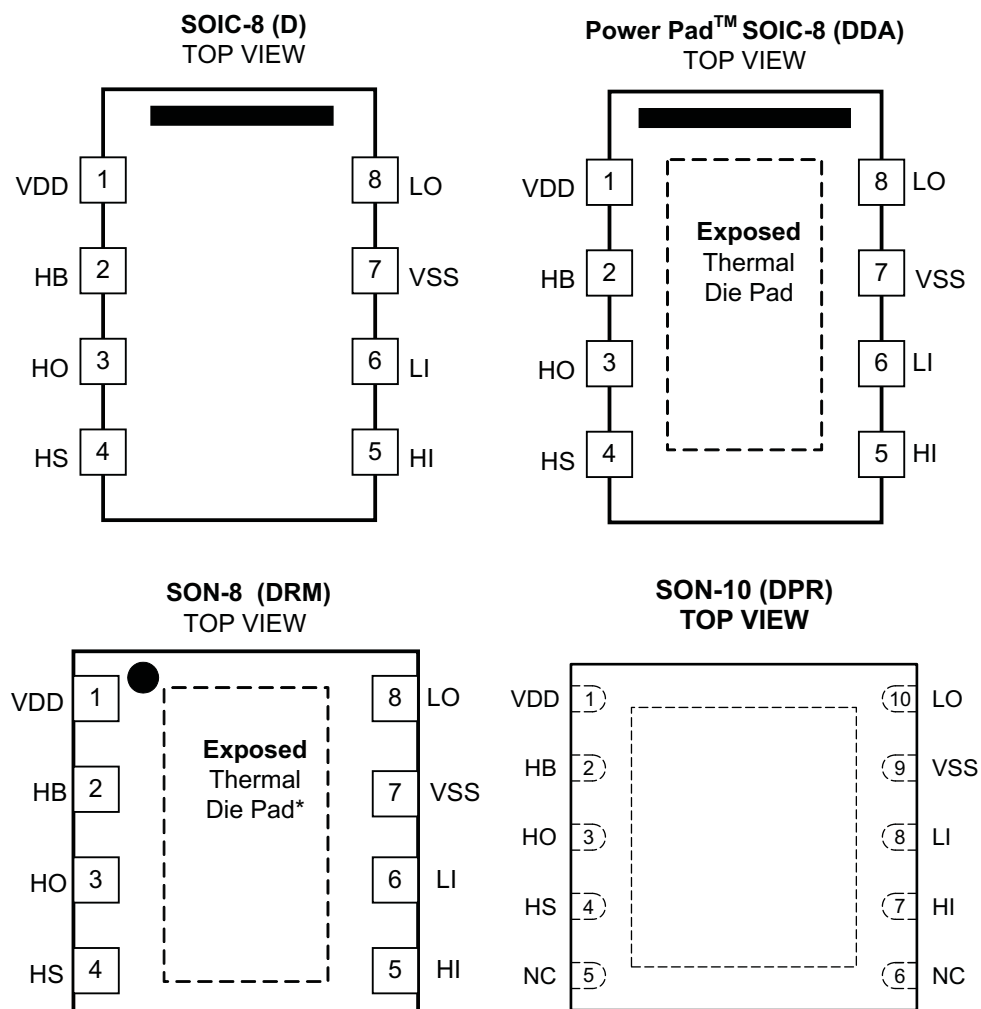

The switching node (HS pin) of the UCC2721x can handle -18 V maximum which allows the high-side channel to be protected from inherent negative voltages caused parasitic inductance and stray capacitance. The UCC27210 (Pseudo-CMOS inputs) and UCC27211 (TTL inputs) have increased hysteresis allowing for interface to analog or digital PWM controllers with enhanced noise immunity.

The low-side and high-side gate drivers are independently controlled and matched to 2 ns between the turnon and turnoff of each other.

An on-chip 120-V rated bootstrap diode eliminates the external discrete diodes. Undervoltage lockout is provided for both the high-side and the low-side drivers providing symmetric turnon and turnoff behavior and forcing the outputs low if the drive voltage is below the specified threshold.

Both devices are offered in 8-pin SOIC (D), PowerPAD SOIC-8 (DDA), 4-mm \times 4-mm SON-8 (DRM) and SON-10 (DPR) packages.

6 Pin Configuration and Functions

Pin Functions

PIN			I/O	DESCRIPTION
NAME	D/DDA/DRM	DPR		
VDD	1	1	P	Positive supply to the lower-gate driver. Decouple this pin to V_{SS} (GND). Typical decoupling capacitor range is 0.22 μF to 4.7 μF (See ⁽¹⁾).
HB	2	2	P	High-side bootstrap supply. The bootstrap diode is on-chip but the external bootstrap capacitor is required. Connect positive side of the bootstrap capacitor to this pin. Typical range of HB bypass capacitor is 0.022 μF to 0.1 μF . The capacitor value is dependant on the gate charge of the high-side MOSFET and should also be selected based on speed and ripple criteria
HO	3	3	O	High-side output. Connect to the gate of the high-side power MOSFET.
HS	4	4	P	High-side source connection. Connect to source of high-side power MOSFET. Connect the negative side of bootstrap capacitor to this pin.
HI	5	7	I	High-side input. ⁽²⁾
LI	6	8	I	Low-side input. ⁽²⁾
VSS	7	9	G	Negative supply terminal for the device which is generally grounded.
LO	8	10	O	Low-side output. Connect to the gate of the low-side power MOSFET.
N/C	—	5/6	—	Not connected.
PowerPAD™ ⁽³⁾	Pad	Pad	G	Used on the DDA, DRM and DPR packages only. Electrically referenced to V_{SS} (GND). Connect to a large thermal mass trace or GND plane to dramatically improve thermal performance.

- (1) For cold temperature applications we recommend the upper capacitance range. Attention should also be made to PCB layout - see [Layout](#).
- (2) HI or LI input is assumed to connect to a low impedance source signal. The source output impedance is assumed less than 100 Ω . If the source impedance is greater than 100 Ω , add a bypassing capacitor, each, between HI and VSS and between LI and VSS. The added capacitor value depends on the noise levels presented on the pins, typically from 1 nF to 10 nF should be effective to eliminate the possible noise effect. When noise is present on two pins, HI or LI, the effect is to cause HO and LO malfunctions to have wrong logic outputs.
- (3) The PowerPAD™ is not directly connected to any leads of the package. However it is electrically and thermally connected to the substrate which is the ground of the device.

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply voltage range, V_{DD} ⁽²⁾ , $V_{HB} - V_{HS}$	-0.3	20	V
Input voltages on LI and HI, V_{LI} , V_{HI}	-10	20	
Output voltage on LO, V_{LO}	DC	$V_{DD} + 0.3$	
	Repetitive pulse <100 ns ⁽³⁾	$V_{DD} + 0.3$	
Output voltage on HO, V_{HO}	DC	$V_{HS} - 0.3$ $V_{HB} + 0.3$	
	Repetitive pulse <100 ns ⁽³⁾	$V_{HS} - 2$ $V_{HB} + 0.3$	
Voltage on HS, V_{HS}	DC	-1 115	
	Repetitive pulse <100 ns ⁽³⁾	$-(24 \text{ V} - V_{DD})$ 115	
Voltage on HB, V_{HB}	-0.3	120	
Operating virtual junction temperature, T_J	-40	150	°C
Lead temperature (soldering, 10 sec.)		300	
Storage temperature, T_{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to VSS unless otherwise noted. Currents are positive into, negative out of the specified terminal.
- (3) Verified at bench characterization. VDD is the value used in an application design.

7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

all voltages are with respect to V_{SS} ; currents are positive into and negative out of the specified terminal. $-40^{\circ}\text{C} < T_J = T_A < 140^{\circ}\text{C}$ (unless otherwise noted)

	MIN	TYP	MAX	UNIT
Supply voltage range, V_{DD} , V_{HB} - V_{HS}	8	12	17	V
Voltage on HS, V_{HS}	-1		105	
Voltage on HS, V_{HS} (repetitive pulse <100 ns)	-(24V-VDD)		110	
Voltage on HB, V_{HB}	$V_{HS} +8$, $V_{DD} -1$		$V_{HS} +17$, 115	
Voltage slew rate on HS			50	V/ns
Operating junction temperature range	-40		140	$^{\circ}\text{C}$

7.4 Thermal Information

THERMAL METRIC	UCC27210, UCC27211				UNIT
	D	DDA	DRM	DPR	
	8 PINS	8 PINS	8 PINS	10 PINS	
θ_{JA} Junction-to-ambient thermal resistance ⁽¹⁾	111.8	37.7	33.9	36.8	$^{\circ}\text{C}/\text{W}$
θ_{JCTop} Junction-to-case (top) thermal resistance ⁽²⁾	56.9	47.2	33.2	36.0	
θ_{JB} Junction-to-board thermal resistance ⁽³⁾	53.0	9.6	11.4	14.0	
ψ_{JT} Junction-to-top characterization parameter ⁽⁴⁾	7.8	2.8	0.4	0.3	
ψ_{JB} Junction-to-board characterization parameter ⁽⁵⁾	52.3	9.4	11.7	14.2	
θ_{JCbott} Junction-to-case (bottom) thermal resistance ⁽⁶⁾	n/a	3.6	2.3	3.4	

(1) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.

(2) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

(3) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

(4) The junction-to-top characterization parameter, ψ_{JT} , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $R_{\theta JA}$, using a procedure described in JESD51-2a (sections 6 and 7).

(5) The junction-to-board characterization parameter, ψ_{JB} , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $R_{\theta JA}$, using a procedure described in JESD51-2a (sections 6 and 7).

(6) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

7.5 Electrical Characteristics

$V_{DD} = V_{HB} = 12\text{ V}$, $V_{HS} = V_{SS} = 0\text{ V}$, no load on LO or HO, $T_A = T_J = -40^\circ\text{C}$ to 140°C , (unless otherwise noted)

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
SUPPLY CURRENTS							
I_{DD}	V_{DD} quiescent current	$V(\text{LI}) = V(\text{HI}) = 0\text{ V}$	0.05	0.085	0.17	mA

8 Detailed Description

8.1 Overview

The UCC27210 and UCC27211 devices represent Texas Instruments' latest generation of high voltage gate drivers which are designed to drive both the high side and low side of N-channel MOSFETs in a half-/full-bridge or synchronous buck configuration. The floating high-side driver can operate with supply voltages of up to 120 V. This allows for N-channel MOSFET control in half-bridge, full-bridge, push pull, two-switch forward and active clamp forward converters.

The UCC27210 and UCC27211 devices feature 4-A source/sink capability, industry best-in-class switching characteristics and a host of other features listed in [Table 1](#). These features combine to ensure efficient, robust and reliable operation in high-frequency switching power circuits.

Table 1. UCC27210 and UCC27211 Highlights

FEATURE	BENEFIT
4-A source and sink current with 0.9-Ω output resistance	High peak current ideal for driving large power MOSFETs with minimal power loss (fast-drive capability at Miller plateau)
Input pins (HI and LI) can directly handle –10 VDC up to 20 VDC	Increased robustness and ability to handle under/overshoot. Can interface directly to gate-drive transformers without having to use rectification diodes
120-V internal boot diode	Provides voltage margin to meet telecom 100-V surge requirements
Switch node (HS pin) able to handle –18 V maximum for 100 ns	Allows the high-side channel to have extra protection from inherent negative voltages caused parasitic inductance and stray capacitance.
Robust ESD circuitry to handle voltage spikes	Excellent immunity to large dV/dT conditions
18-ns propagation delay with 7.2-ns / 5.5-ns rise/fall Times	Best-in-class switching characteristics and extremely low-pulse transmission distortion
2-ns (typ) delay matching between channels	Avoids transformer volt-second offset in bridge
Symmetrical UVLO circuit	Ensures high-side and low-side shut down at the same time
CMOS optimized threshold or TTL optimized thresholds with increased hysteresis	Complementary to analog or digital PWM controllers. Increased hysteresis offers added noise immunity

In the UCC27210 and UCC27211 devices, the high side and low side each have independent inputs which allow maximum flexibility of input control signals in the application. The boot diode for the high-side driver bias supply is internal to the UCC27210 and UCC27211. The UCC27210 is the Pseudo-CMOS compatible input version and the UCC27211 is the TTL or logic compatible version. The high-side driver is referenced to the switch node (HS) which is typically the source pin of the high-side MOSFET and drain pin of the low-side MOSFET. The low-side driver is referenced to V_{SS} which is typically ground. The functions contained are the input stages, UVLO protection, level shift, boot diode, and output driver stages.

8.3 Feature Description

8.3.1 Input Stages

The input stages provide the interface to the PWM output signals. The input impedance of the UCC27210 is 100 k Ω nominal and input capacitance is approximately 2 pF. The 100 k Ω is a pull-down resistance to V_{SS} (ground). The UCC27210 Pseudo-CMOS input structure has been designed to provide large hysteresis and at the same time to allow interfacing to a multitude of analog or digital PWM controllers. In some CMOS designs, the input thresholds are determined as a percentage of V_{DD} . By doing so, the high-level input threshold can become unreasonably high and unusable. The UCC27210 recognizes the fact that V_{DD} levels are trending downward and it therefore provides a rising threshold with 5.0 V (typical) and falling threshold with 3.2 V (typical). The input hysteresis of the UCC27210 is 1.8 V (typical).

The input stages of the UCC27211 have impedance of 70 k Ω nominal and input capacitance is approximately 2 pF. Pull-down resistance to V_{SS} (ground) is 70 k Ω . The logic level compatible input provides a rising threshold of 2.3 V and a falling threshold of 1.6 V.

8.3.2 Undervoltage Lockout (UVLO)

The bias supplies for the high-side and low-side drivers have UVLO protection. V_{DD} as well as V_{HB} to V_{HS} differential voltages are monitored. The V_{DD} UVLO disables both drivers when V_{DD} is below the specified threshold. The rising V_{DD} threshold is 7.0 V with 0.5-V hysteresis. The V_{HB} UVLO disables only the high-side driver when the V_{HB} to V_{HS} differential voltage is below the specified threshold. The V_{HB} UVLO rising threshold is 6.7 V with 1.1-V hysteresis.

8.3.3 Level Shift

The level shift circuit is the interface from the high-side input to the high-side driver stage which is referenced to the switch node (HS). The level shift allows control of the HO output referenced to the HS pin and provides excellent delay matching with the low-side driver.

Feature Description (continued)

8.3.4 Boot Diode

The boot diode necessary to generate the high-side bias is included in the UCC27210 and UCC27211 family of drivers. The diode anode is connected to V_{DD} and cathode connected to V_{HB} . With the V_{HB} capacitor connected to HB and the HS pins, the V_{HB} capacitor charge is refreshed every switching cycle when HS transitions to ground. The boot diode provides fast recovery times, low diode resistance, and voltage rating margin to allow for efficient and reliable operation.

8.3.5 Output Stages

The output stages are the interface to the power MOSFETs in the power train. High slew rate, low resistance and high peak current capability of both output drivers allow for efficient switching of the power MOSFETs. The low-side output stage is referenced from V_{DD} to V_{SS} and the high side is referenced from V_{HB} to V_{HS} .

8.4 Device Functional Modes

The device operates in normal mode and UVLO mode. See the [Undervoltage Lockout \(UVLO\)](#) section for information on UVLO operation mode. In the normal mode the output state is dependent on states of the HI and LI pins. [Table 2](#) lists the output states for different input pin combinations.

Table 2. Device Logic Table

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

To effect fast switching of power devices and reduce associated switching power losses, a powerful gate driver is employed between the PWM output of controllers and the gates of the power semiconductor devices. Also, gate drivers are indispensable when it is impossible for the PWM controller to directly drive the gates of the switching devices. With the advent of digital power, this situation will be often encountered because the PWM signal from the digital controller is often a 3.3-V logic signal which cannot effectively turn on a power switch. Level shifting circuitry is needed to boost the 3.3-V signal to the gate-drive voltage (such as 12 V) in order to fully turn on the power device and minimize conduction losses. Traditional buffer drive circuits based on NPN/PNP bipolar transistors in totem-pole arrangement, being emitter follower configurations, prove inadequate with digital power because they lack level-shifting capability. Gate drivers effectively combine both the level-shifting and buffer-drive functions. Gate drivers also find other needs such as minimizing the effect of high-frequency switching noise by locating the high-current driver physically close to the power switch, driving gate-drive transformers and controlling floating power-device gates, reducing power dissipation and thermal stress in controllers by moving gate charge power losses from the controller into the driver.

Finally, emerging wide band-gap power device technologies such as GaN based switches, which are capable of supporting very high switching frequency operation, are driving very special requirements in terms of gate drive capability. These requirements include operation at low VDD voltages (5 V or lower), low propagation delays and availability in compact, low-inductance packages with good thermal capability. In summary gate-driver devices are extremely important components in switching power, combining benefits of high-performance, low-cost component count and board-space reduction as well as simplified system design.

9.2 Typical Application

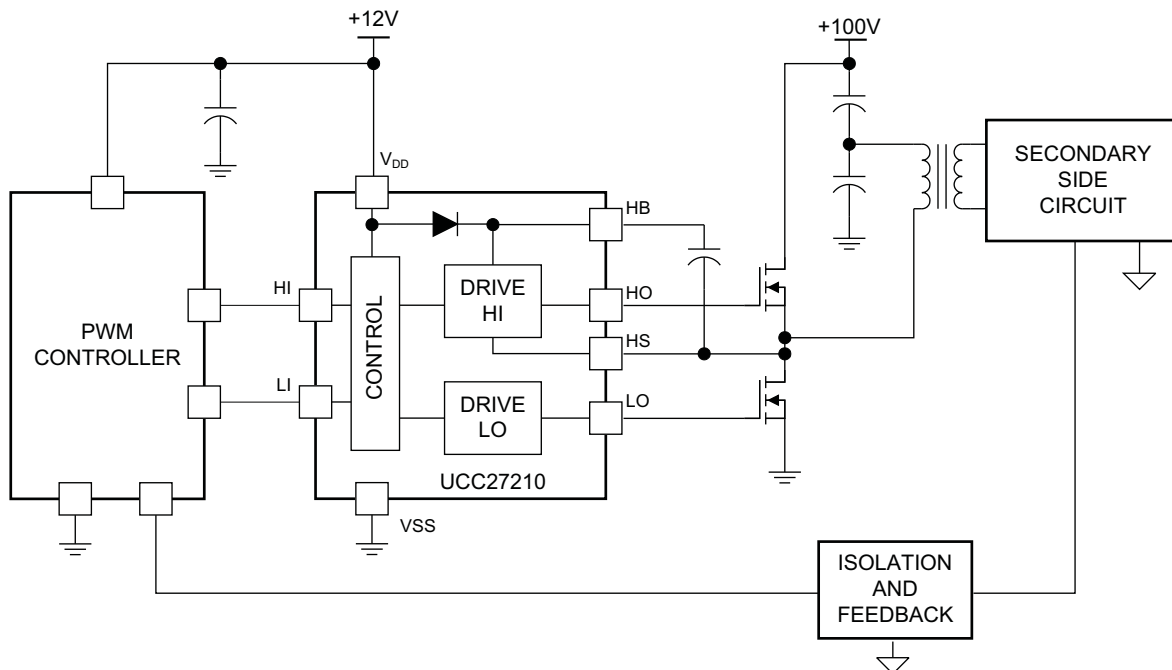

Figure 19. Typical Application Diagram: UCC27210

Typical Application (continued)

Figure 20. Typical Application Diagram: UCC27211

9.2.1 Design Requirements

Table 3. Design Specifications

DESIGN PARAMETER	EXAMPLE VALUE
Supply voltage, VDD	12 V
Voltage on HS, VHS	0 V to 100 V
Voltage on HB, VHB	12 V to 112 V
Output current rating, IO	–4 A to 4 A
Operating frequency	500 kHz

9.2.2 Detailed Design Procedure

9.2.2.1 Input Threshold Type

The UCC27210 and UCC27211 have an input maximum voltage range from -10 V to 20 V . This increased robustness means that both parts can be directly interfaced to gate drive transformers. The UCC27210 features pseudo CMOS compatible inputs and UCC27211 features TTL compatible input threshold logic, with wide hysteresis. The threshold voltage levels are low voltage and independent of the VDD supply voltage, which allows compatibility with both logic-level input signals from microcontrollers as well as higher-voltage input signals from analog controllers. See the [Electrical Characteristics](#) table for the actual input threshold voltage levels and hysteresis specifications for the UCC27210 and UCC27211 devices.

9.2.2.2 V_{DD} Bias Supply Voltage

The bias supply voltage to be applied to the VDD pin of the device should never exceed the values listed in the [Recommended Operating Conditions](#) table. However, different power switches demand different voltage levels to be applied at the gate terminals for effective turnon and turnoff. With certain power switches, a positive gate voltage may be required for turnon and a negative gate voltage may be required for turnoff, in which case the VDD bias supply equals the voltage differential. With a wide operating range from 8 V to 17 V , the UCC27210 and UCC27211 devices can be used to drive a variety of power switches, such as Si MOSFETs, IGBTs, and wide-bandgap power semiconductors (such as GaN, certain types of which allow no higher than 6 V to be applied to the gate terminals).

9.2.2.3 Peak Source and Sink Currents

Generally, the switching speed of the power switch during turnon and turnoff should be as fast as possible in order to minimize switching power losses. The gate driver device must be able to provide the required peak current for achieving the targeted switching speeds with the targeted power MOSFET. The system requirement for the switching speed is typically described in terms of the slew rate of the drain-to-source voltage of the power MOSFET (such as dV_{DS}/dt). For example, the system requirement might state that a SPP20N60C3 power MOSFET must be turned-on with a dV_{DS}/dt of 20V/ns or higher with a DC bus voltage of 400 V in a continuous-conduction-mode (CCM) boost PFC-converter application. This type of application is an inductive hard-switching application and reducing switching power losses is critical. This requirement means that the entire drain-to-source voltage swing during power MOSFET turnon event (from 400 V in the OFF state to $V_{DS(on)}$ in on state) must be completed in approximately 20 ns or less. When the drain-to-source voltage swing occurs, the Miller charge of the power MOSFET (QGD parameter in SPP20N60C3 data sheet is 33 nC typical) is supplied by the peak current of gate driver. According to power MOSFET inductive switching mechanism, the gate-to-source voltage of the power MOSFET at this time is the Miller plateau voltage, which is typically a few volts higher than the threshold voltage of the power MOSFET, $V_{GS(TH)}$.

To achieve the targeted dV_{DS}/dt , the gate driver must be capable of providing the Q_{GD} charge in 20 ns or less. In other words a peak current of 1.65 A ($= 33\text{ nC} / 20\text{ ns}$) or higher must be provided by the gate driver. The UCC27210 and UCC27211 gate driver is capable of providing 4-A peak sourcing current which clearly exceeds the design requirement and has the capability to meet the switching speed needed. The $2.4\times$ overdrive capability provides an extra margin against part-to-part variations in the Q_{GD} parameter of the power MOSFET along with additional flexibility to insert external gate resistors and fine tune the switching speed for efficiency versus EMI optimizations. However, in practical designs the parasitic trace inductance in the gate drive circuit of the PCB will have a definitive role to play on the power MOSFET switching speed. The effect of this trace inductance is to limit the dI/dt of the output current pulse of the gate driver. In order to illustrate this, consider output current pulse waveform from the gate driver to be approximated to a triangular profile, where the area under the triangle ($\frac{1}{2} \times I_{PEAK} \times \text{time}$) would equal the total gate charge of the power MOSFET (QG parameter in SPP20N60C3 power MOSFET datasheet = 87 nC typical). If the parasitic trace inductance limits the dI/dt then a situation may occur in which the full peak current capability of the gate driver is not fully achieved in the time required to deliver the QG required for the power MOSFET switching. In other words the time parameter in the equation would dominate and the I_{PEAK} value of the current pulse would be much less than the true peak current capability of the device, while the required QG is still delivered. Because of this, the desired switching speed may not be realized, even when theoretical calculations indicate the gate driver is capable of achieving the targeted switching speed. Thus, placing the gate driver device very close to the power MOSFET and designing a tight gate drive-loop with minimal PCB trace inductance is important to realize the full peak-current capability of the gate driver.

9.2.2.4 Propagation Delay

The acceptable propagation delay from the gate driver is dependent on the switching frequency at which it is used and the acceptable level of pulse distortion to the system. The UCC27210 features 21 ns and the UCC27211 features 17 ns (typical) propagation delays which ensures very little pulse distortion and allows operation at very high-frequencies. See the [Electrical Characteristics](#) table for the propagation and switching characteristics of the UCC27210 and UCC27211 devices.

9.2.2.5 Power Dissipation

Power dissipation of the gate driver has two portions as shown in [Equation 1](#).

$$P_{DISS} = P_{DC} + P_{SW} \quad (1)$$

The DC portion of the power dissipation is $P_{DC} = I_Q \times V_{DD}$ where I_Q is the quiescent current for the driver. The quiescent current is the current consumed by the device to bias all internal circuits such as input stage, reference voltage, logic circuits, protections, and also any current associated with switching of internal devices when the driver output changes state (such as charging and discharging of parasitic capacitances, parasitic shoot-through, and so forth). The UCC27210 and UCC27211 features very low quiescent currents (less than 0.17 mA, refer to the [Electrical Characteristics](#) table and contain internal logic to eliminate any shoot-through in the output driver stage. Thus the effect of the PDC on the total power dissipation within the gate driver can be safely assumed to be negligible. The power dissipated in the gate-driver package during switching (P_{SW}) depends on the following factors:

- Gate charge required of the power device (usually a function of the drive voltage V_G , which is very close to input bias supply voltage V_{DD})
- Switching frequency
- Use of external gate resistors. When a driver device is tested with a discrete, capacitive load calculating the power that is required from the bias supply is fairly simple. The energy that must be transferred from the bias supply to charge the capacitor is given by [Equation 2](#).

$$E_G = \frac{1}{2} C_{LOAD} V_{DD}^2 f_{SW}$$

where

- C_{LOAD} is load capacitor
 - V_{DD} is bias voltage feeding the driver
- (2)

There is an equal amount of energy dissipated when the capacitor is charged. This leads to a total power loss given by [Equation 3](#).

$$P_G = C_{LOAD} V_{DD}^2 f_{SW}$$

where

- f_{SW} is the switching frequency
- (3)

The switching load presented by a power MOSFET/IGBT is converted to an equivalent capacitance by examining the gate charge required to switch the device. This gate charge includes the effects of the input capacitance plus the added charge needed to swing the drain voltage of the power device as it switches between the ON and OFF states. Most manufacturers provide specifications of typical and maximum gate charge, in nC, to switch the device under specified conditions. Using the gate charge Q_G , determine the power that must be dissipated when charging a capacitor which is calculated using the equation $Q_G = C_{LOAD} \times V_{DD}$ to provide [Equation 4](#) for power.

$$P_G = C_{LOAD} V_{DD}^2 f_{SW} = Q_G V_{DD} f_{SW} \quad (4)$$

This power P_G is dissipated in the resistive elements of the circuit when the MOSFET/IGBT is being turned on or off. Half of the total power is dissipated when the load capacitor is charged during turnon, and the other half is dissipated when the load capacitor is discharged during turnoff. When no external gate resistor is employed between the driver and MOSFET/IGBT, this power is completely dissipated inside the driver package. With the use of external gate-drive resistors, the power dissipation is shared between the internal resistance of driver and external gate resistor.

9.2.3 Application Curves

Figure 21. Negative 10-V Input

Figure 22. Step Input

Figure 23. Symmetrical UVLO

10 Power Supply Recommendations

The bias supply voltage range for which the UCC27210 and UCC27211 device is rated to operate is from 8 V to 17 V. The lower end of this range is governed by the internal undervoltage-lockout (UVLO) protection feature on the V_{DD} pin supply circuit blocks. Whenever the driver is in UVLO condition when the V_{DD} pin voltage is below the $V_{(ON)}$ supply start threshold, this feature holds the output low, regardless of the status of the inputs. The upper end of this range is driven by the 20-V absolute maximum voltage rating of the V_{DD} pin of the device (which is a stress rating). Keeping a 3-V margin to allow for transient voltage spikes, the maximum recommended voltage for the V_{DD} pin is 17 V. The UVLO protection feature also involves a hysteresis function. This means that when the V_{DD} pin bias voltage has exceeded the threshold voltage and device begins to operate, and if the voltage drops, then the device continues to deliver normal functionality unless the voltage drop exceeds the hysteresis specification $V_{DD(hys)}$. Therefore, ensuring that, while operating at or near the 8-V range, the voltage ripple on the auxiliary power supply output is smaller than the hysteresis specification of the device is important to avoid triggering device shutdown. During system shutdown, the device operation continues until the V_{DD} pin voltage has dropped below the $V_{(OFF)}$ threshold which must be accounted for while evaluating system shutdown timing design requirements. Likewise, at system startup, the device does not begin operation until the V_{DD} pin voltage has exceeded above the $V_{(ON)}$ threshold. The quiescent current consumed by the internal circuit blocks of the device is supplied through the V_{DD} pin. Although this fact is well known, recognizing that the charge for source current pulses delivered by the HO pin is also supplied through the same V_{DD} pin is important. As a result, every time a current is sourced out of the HO pin a corresponding current pulse is delivered into the device through the V_{DD} pin. Thus ensuring that a local bypass capacitor is provided between the V_{DD} and GND pins and located as close to the device as possible for the purpose of decoupling is important. A low ESR, ceramic surface mount capacitor is a must. TI recommends using a capacitor in the range 0.22 μ F to 4.7 μ F between V_{DD} and GND. In a similar manner, the current pulses delivered by the LO pin are sourced from the HB pin. Therefore a 0.022- μ F to 0.1- μ F local decoupling capacitor is recommended between the HB and HS pins.

11 Layout

11.1 Layout Guidelines

To improve the switching characteristics and efficiency of a design, the following layout rules should be followed.

- Locate the driver as close as possible to the MOSFETs.
- Locate the V_{DD} - V_{SS} and V_{HB} - V_{HS} (bootstrap) capacitors as close as possible to the device (see [Figure 24](#)).
- Pay close attention to the GND trace. Use the thermal pad of the DDA and DRM package as GND by connecting it to the VSS pin (GND). The GND trace from the driver goes directly to the source of the MOSFET but should not be in the high current path of the MOSFET(S) drain or source current.
- Use similar rules for the HS node as for GND for the high-side driver.
- For systems using multiple UCC27210 and UCC27211 devices we recommend that dedicated decoupling capacitors be located at V_{DD} - V_{SS} for each device.
- Care should be taken to avoid VDD traces being close to LO, HS, and HO signals.
- Use wide traces for LO and HO closely following the associated GND or HS traces. 60 to 100-mils width is preferable where possible.
- Use as least two or more vias if the driver outputs or SW node must be routed from one layer to another. For GND the number of vias must be a consideration of the thermal pad requirements as well as parasitic inductance.
- Avoid LI and HI (driver input) going close to the HS node or any other high dV/dT traces that can induce significant noise into the relatively high impedance leads.

Keep in mind that a poor layout can cause a significant drop in efficiency or system malfunction versus a good PCB layout and can even lead to decreased reliability of the whole system.

11.2 Layout Example

Figure 24. UCC27210/11 Component Placement

11.3 Thermal Considerations

The useful range of a driver is greatly affected by the drive-power requirements of the load and the thermal characteristics of the package. In order for a gate driver to be useful over a particular temperature range the package must allow for the efficient removal of the heat produced while keeping the junction temperature within rated limits. The thermal metrics for the driver package is listed in [Device Functional Modes](#). For detailed information regarding the table, please refer to the Application Note from Texas Instruments entitled *IC Package Thermal Metrics* ([SPRA953](#)). The UCC27210 and UCC27211 devices are offered in SOIC (8), PowerPad (8), WSON (10) or VSON (8). The [Thermal Information](#) section lists the thermal performance metrics related to SOT-23 package.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Refer to the product data sheet for package details.

DDA (R-PDSO-G8)

PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4206322-6/L 05/12

NOTE: A. All linear dimensions are in millimeters

PowerPAD is a trademark of Texas Instruments

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
